

Hierarchical Planning -
MOLGEN

By
Zack Stoecker-Sylvia

Overview

- There are two MOLGEN planners
 - Friedland, 1979
 - Stefik, 1980
- Assists molecular geneticists in developing plans for laboratory experiments
- Meant more as an experiment in planning systems than an actual tool

Primary Concepts

- Hierarchical Planning
- Constraint Posting
- Least Commitment Planning
- Frame Based Objects
- Layered Control Structure

Hierarchical Planning

- Start with a very basic plan

Have Lunch

The slide features a black background with a horizontal rainbow-colored gradient bar. The title 'Hierarchical Planning' is written in a gold, italicized serif font. Below the title, a bullet point indicates to 'Start with a very basic plan'. To the right of this text is a red-outlined rectangle containing the text 'Have Lunch' in a simple black font.

Hierarchical Planning

- Start with a very basic plan
- Continually refine plan steps into more specific plans

Hierarchical Planning

- Start with a very basic plan
- Continually refine plan steps into more specific plans

Hierarchical Planning

- Sub-plans interact in all but ideal circumstances
 - Food from “Eat Food” must be the same as the Food from “Order Food”

Hierarchical Planning

- Sub-plans interact in all but ideal circumstances
 - *Food* from “Eat *Food*” must be the same as the *Food* from “Order *Food*”
 - *Restaurant* must serve the type of *Food* you want to eat

Hierarchical Planning

- Two methods of dealing with interaction
 - Backtracking
 - Constraint Posting

Constraint Posting

- Constraints represent relationships between plan variables
- Variables may be either operators or objects
- Constraints may exist within plans as well as between plans
- When new plans are refined, existing constraints are inherited

Benefits of Constraint Posting

- Elimination of invalid possibilities
 - If *Restaurant* only serves Italian food, the only possible values of *Food* are Italian foods
- Partial description of objects
- Expression of relationships between plan variables

Least Commitment Planning

- Choices about refinement of plans and variables are deferred as long as possible
- When decisions are made, the valid options for other variables decrease
- Further constraints may be discovered
- Choices made under least commitment are never “wrong”

Guessing

- When no “safe” refinements can be made the value of a variable must be heuristically guessed
- Guessing can lead to backtracking
 - Backtracking need only be performed on guessed variables (and refinements or definitions based on those variables)
- Hopefully, information gained from guessing leads to other “safe” refinements

Frame Based Objects

- Objects (including operators) in MOLGEN are all created from a generic object of its type
- These generic objects contain standard information about that object type as well as possibly relationships to more abstract parent objects
- Information in specific object instances may change throughout the course of an experiment

MOLGEN's Control Structure

- Works with layers which control the use of information on the layer below them
- Contains three layers and a main interpreter
 - Strategy Layer
 - Design Layer
 - Laboratory Layer

Laboratory Space - Objects

- 74 different generic objects are represented ex:
 - Antibiotics
 - DNA Structures
 - Genes
 - Plasmids
 - Enzymes
 - Organisms

Laboratory Space - Operators

- 4 different abstract groupings
 - Merge
 - Amplify
 - React
 - Sort
- Referred to as “MARS” operators
- 13 specific operators represent specializations of these groupings

Design Space - Objects

- 4 objects used to store planning information
 - Constraint
 - Difference
 - Refinement
 - Tuple

Strategy Space and Interpretation

- Strategy space contains generic planning actions
 - Least-Commitment
 - FOCUS
 - RESUME
 - Heuristic
 - GUESS
 - UNDO

Strategy Space and Interpretation

- FOCUS creates new steps in order to reduce the difference between steps

Strategy Space and Interpretation

- RESUME attempts to resume suspended steps that may now be able to progress

Strategy Space and Interpretation

- GUESS heuristically guesses which variable value is most likely correct

Strategy Space and Interpretation

- UNDO cancels the instantiation of a variable guess

Strategy Space and Interpretation

- The interpreter will choose one of these actions to pursue
- The interpreter tries to perform the *Least-Commitment* actions first before resorting to heuristic methods

Conclusion

- MOLGEN is a well thought out planning tool, it uses combines least-commitment and heuristic planning well
- MOLGEN relies heavily on domain specific knowledge to guide the process
- MOLGEN was never meant to be an actual laboratory planning tool
 - The area was far too complex
 - Experiments often call for expert knowledge midway through
