Operating System

Process Scheduling
(Ch 4.2, 5.1 - 5.3)

Schedulers

- Short-Term
  - “Which process gets the CPU?”
  - Fast, since once per 100 ms
- Long-Term (batch)
  - “Which process gets the Ready Queue?”
- Medium-Term (Unix)
  - “Which Ready Queue process to memory?”
  - Swapping

CPU-IO Burst Cycle

- Frequency
- Burst Duration
- add
- read
- (I/O Wait)
- store
- increment
- write
- (I/O Wait)

Preemptive Scheduling

- Four times to re-schedule
  1. Running to Waiting (I/O wait)
  2. Running to Ready (time slice)
  3. Waiting to Ready (I/O completion)
  4. Termination
- #2 optional => “Preemptive”
- Timing may cause unexpected results
  - updating shared variable
  - kernel saving state

Question

- What Performance Criteria Should the Scheduler Seek to Optimize?
  - Ex: CPU minimize time spent in queue
  - Others?

Scheduling Criteria

1. CPU utilization (40 to 90)
2. Throughput (processes / hour)
3. Turn-around time
4. Waiting time (in queue)
- Maximize #1, #2   Minimize #3, #4
- Response time
  - Self-regulated by users (go home)
  - Bounded ==> Variance!
First-Come, First-Served

<table>
<thead>
<tr>
<th>Process</th>
<th>Burst Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>8</td>
</tr>
<tr>
<td>B</td>
<td>1</td>
</tr>
<tr>
<td>C</td>
<td>1</td>
</tr>
</tbody>
</table>

Gantt Chart

- Avg Wait Time \( (0 + 8 + 9) / 3 = 5.7 \)

Shortest Job First

<table>
<thead>
<tr>
<th>Process</th>
<th>Burst Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>8</td>
</tr>
<tr>
<td>B</td>
<td>1</td>
</tr>
<tr>
<td>C</td>
<td>1</td>
</tr>
</tbody>
</table>

Gantt Chart

- Avg Wait Time \( (0 + 1 + 2) / 3 = 1 \)
- Optimal Avg Wait
- Prediction tough ... Ideas?

Priority Scheduling

- SJF is a special case

<table>
<thead>
<tr>
<th>Process</th>
<th>Burst Time</th>
<th>Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>8</td>
<td>2</td>
</tr>
<tr>
<td>B</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>C</td>
<td>1</td>
<td>3</td>
</tr>
</tbody>
</table>

Gantt Chart

- Avg Wait Time \( (0 + 1 + 9) / 3 = 3.3 \)

Priority Scheduling Criteria?

- Internal
  - open files
  - memory requirements
  - CPU time used
  - process age
  - I/O wait completed
- External
  - $ department sponsoring work
  - process importance
  - super-user (root) nice

Round Robin

- Fixed time-slice and Preemption

<table>
<thead>
<tr>
<th>Process</th>
<th>Burst Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>5</td>
</tr>
<tr>
<td>B</td>
<td>3</td>
</tr>
<tr>
<td>C</td>
<td>3</td>
</tr>
</tbody>
</table>

Gantt Chart

- Avg Turnaround = \( (8 + 9 + 11) / 3 = 9.3 \)
- FCFS? SJF?

Questions

- What is a PCB?
- List steps that occur during interrupt
- Explain how SJF works
- True or False:
  - FCFS is optimal in terms of avg waiting time
  - Most processes are CPU bound
  - The shorter the time quantum, the better
Round Robin Fun

<table>
<thead>
<tr>
<th>Process</th>
<th>Burst Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>10</td>
</tr>
<tr>
<td>B</td>
<td>10</td>
</tr>
<tr>
<td>C</td>
<td>10</td>
</tr>
</tbody>
</table>

- Turn-around time?
  - \( q = 10 \)
  - \( q = 1 \)
  - \( q \to 0 \)

More Round Robin Fun

<table>
<thead>
<tr>
<th>Process</th>
<th>Burst Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>6</td>
</tr>
<tr>
<td>B</td>
<td>3</td>
</tr>
<tr>
<td>C</td>
<td>1</td>
</tr>
<tr>
<td>D</td>
<td>7</td>
</tr>
</tbody>
</table>

Rule: 80% within one quantum

Fun with Scheduling

<table>
<thead>
<tr>
<th>Process</th>
<th>Burst Time</th>
<th>Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>10</td>
<td>2</td>
</tr>
<tr>
<td>B</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>C</td>
<td>2</td>
<td>3</td>
</tr>
</tbody>
</table>

- Gantt Charts:
  - FCFS
  - SJF
  - Priority
  - RR \((q=1)\)

- Performance:
  - Throughput
  - Waiting time
  - Turnaround time

More Fun with Scheduling

<table>
<thead>
<tr>
<th>Process</th>
<th>Arrival Time</th>
<th>Burst Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>0.0</td>
<td>8</td>
</tr>
<tr>
<td>B</td>
<td>0.4</td>
<td>4</td>
</tr>
<tr>
<td>C</td>
<td>1.0</td>
<td>1</td>
</tr>
</tbody>
</table>

- Turn around time:
  - FCFS
  - SJF
  - \( q=1 \) CPU idle
  - \( q=0.5 \) CPU idle

Multi-Level Queues

- Categories of processes
  - Priority 1: System
  - Priority 2: Interactive
  - Priority 3: Batch
  - ... ... ...

- Run all in 1 first, then 2 ...
- Starvation!
- Divide between queues: 70% 1, 15% 2 ...

Multi-Level Feedback Queues

- Time slice expensive but want interactive

- Consider process needing 100 quanta
  - 1, 4, 8, 16, 32, 64 = 7 swaps!
- Favor interactive users
Outline

- Processes
  - PCB
  - Interrupt Handlers
- Scheduling
  - Algorithms
  - Linux
  - WinNT

Linux Process Scheduling

- Two classes of processes:
  - Real-Time
  - Normal
- Real-Time:
  - Always run Real-Time above Normal
  - Round-Robin or FIFO
  - “Soft” not “Hard”

Linux Process Scheduling

- Normal: Credit-Based (counter variable)
  - process with most credits is selected
  - brightest function
  - time-slice then lose a credit (0, then suspend)
  - no runnable process (all suspended), add to every process:
    credits = credits/2 + priority
  - Automatically favors I/O bound processes

Windows NT Scheduling

- Basic scheduling unit is a thread
- Priority based scheduling per thread
- Preemptive operating system
- No shortest job first, no quotas

Priority Assignment

- NT kernel uses 31 priority levels
  - 31 is the highest; 0 is system idle thread
  - Realtime priorities: 16 - 31
  - Dynamic priorities: 1 - 15
- Users specify a priority class:
  + realtime (24), high (13), normal (8) and idle (4)
  - and a relative priority:
    + highest (+2), above normal (+1), normal (0), below normal (-1), and lowest (-2)
  - to establish the starting priority
- Threads also have a current priority

Quantum

- Determines how long a Thread runs once selected
- Varies based on:
  - NT Workstation or NT Server
  - Intel or Alpha hardware
  - Foreground/Background application threads
  - How do you think it varies with each?
Dispatcher Ready List

- Keeps track of all Ready-to-execute threads
- Queue of threads assigned to each level

FindReadyThread

- Locates the highest priority thread that is ready to execute
- Scans dispatcher ready list
- Picks front thread in highest priority nonempty queue
- *When is this like round robin?*

Boosting and Decay

- Boost priority
  - Event that “wakes” blocked thread
  - Boosts never exceed priority 15 for dynamic
  - Realtime priorities are not boosted
- Decay priority
  - by one for each quantum
  - decays only to starting priority (no lower)

Starvation Prevention

- Low priority threads may never execute
- “Anti-CPU starvation policy”
  - thread that has not executed for 3 seconds
  - boost priority to 15
  - double quantum
- Decay is swift not gradual after this boost
