

# Lightweight Active Router-Queue Management for Multimedia Networking

M. Parris, K. Jeffay, and F.D. Smith  
 Department of Computer Science  
 University of North Carolina

*Multimedia Computing and Networking (MMCN)*  
 January 1999

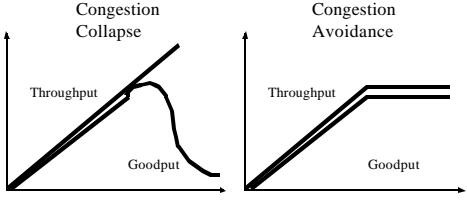

## Outline

- Problem
  - Supporting multimedia on the Internet
- Context
  - Drop Tail
  - RED
  - FRED
- Approach
  - CBT
- Evaluation
- Conclusion

## Congestion on the Internet

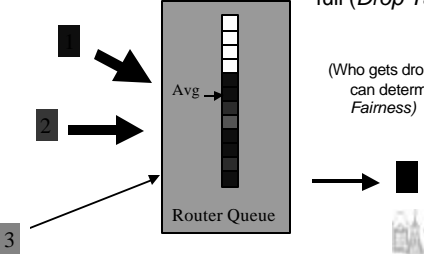

- Drops are the usual way congestion is indicated
- TCP uses congestion avoidance to reduce rate

## Internet Routers

- Queue to hold incoming packets until can be sent
- Typically, drop when queue is full (*Drop Tail*)

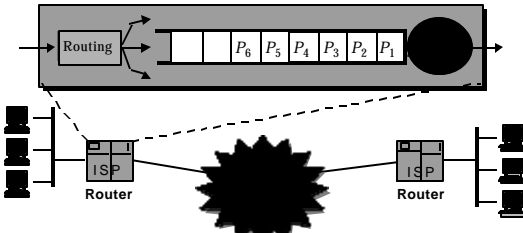

(Who gets dropped can determine *Fairness*)

## Router-Based Congestion Control

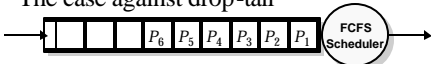

### Solution 2: Closed-loop congestion control

- Normally, packets are only dropped when the queue overflows
  - "Drop-tail" queueing

## Buffer Management & Congestion Avoidance

### The case against drop-tail

- Large queues in routers are a bad thing
  - End-to-end latency is dominated by the length of queues at switches in the network
- Allowing queues to overflow is a bad thing
  - Connections that transmit at high rates can starve connections that transmit at low rates
  - Causes connections to synchronize their response to congestion and become unnecessarily bursty

### Buffer Management & Congestion Avoidance

#### Random early detection (RED) packet drop

- Use an exponential average of the queue length to determine when to drop
  - Accommodates short-term bursts
- Tie the drop probability to the weighted average queue length
  - Avoids over-reaction to mild overload conditions

### Buffer Management & Congestion Avoidance

#### Random early detection (RED) packet drop

- Amount of packet loss is roughly proportional to a connection's bandwidth utilization
  - But there is no a priori bias against bursty sources
- Average connection latency is lower
- Average throughput ("goodput") is higher

### Buffer Management & Congestion Avoidance

#### Random early detection (RED) packet drop

- RED is controlled by 5 parameters
  - $qlen$  — The maximum length of the queue
  - $w_q$  — Weighting factor for average queue length computation
  - $min_{th}$  — Minimum queue length for triggering probabilistic drops
  - $max_{th}$  — Queue length threshold for triggering forced drops
  - $max_p$  — The maximum drop probability

### Random Early Detection Algorithm

```

for each packet arrival:
  calculate the average queue size ave
  if ave < min_th
    do nothing
  else if min_th < ave < max_th
    calculate drop probability p
    drop arriving packet with probability p
  else if max_th < ave
    drop the arriving packet
  
```

- The average queue length computation needs to be low pass filtered to smooth out transients due to bursts
  - $ave = (1 - w_q)ave + w_qq$

### Buffer Management & Congestion Avoidance

#### Random early detection (RED) packet drop

### Random Early Detection Performance

- Floyd/Jacobson simulation of two TCP (*ftp*) flows

## Random Early Detection (RED) Summary

- Controls average queue size
- Drop early to signal impending congestion
- Drops proportional to bandwidth, but drop rate equal for all flows
- Unresponsive traffic will still not slow down!

WPI

## Vulnerability to Misbehaving

- TCP performance on a 10 Mbps link under RED in the face of a "UDP" blast

WPI

## Router-Based Congestion Control

### Dealing with heterogeneous/non-responsive flows

- TCP requires protection/isolation from non-responsive flows
- Solutions?
  - Employ fair-queuing/link scheduling mechanisms
  - Identify and police non-responsive flows (not here)
  - Employ fair buffer allocation within a RED mechanism

WPI

## Flows

### Isolating responsive and non-responsive flows

- Class-based Queuing (CBQ) (Floyd/Jacobson) provides fair allocation of bandwidth to traffic classes
  - Separate queues are provided for each traffic class and serviced in round robin order (or weighted round robin)
  - $n$  classes each receive exactly  $1/n$  of the capacity of the link
- Separate queues ensure perfect isolation between classes
- Drawback: 'reservation' of bandwidth and state information required

WPI

## Dealing with Non-Responsive Flows

### CBQ

WPI

## Dealing with Non-Responsive Flows

- Isolation can be achieved by reserving capacity for flows within a single FIFO queue
  - Rather than maintain separate queues, keep counts of packets in a single queue
- Lin/Morris: Modify RED to perform fair buffer allocation between active flows
  - Independent of protection issues, fair buffer allocation between TCP connections is also desirable

WPI

## Flow Random Early Detect (FRED)

- In RED, 10 Mbps  $\rightarrow$  9 Mbps and 1Mbps  $\rightarrow$  .9 Mbps
  - Unfair
- In FRED, leave 1 Mbps untouched until 10 Mbps is down

- Separate drop probabilities per flow
- "Light" flows have no drops, heavy flows have high drops

## Flow Random Early Detection Performance in the face of non-responsive flows

Time (secs)	FRED Throughput (KBytes/sec)	RED Throughput (KBytes/sec)
0 - 20	~1000	~1000
20 - 60 (UDP Bulk Transfer)	~1000	~300
60 - 100	~1000	~1000

## Congestion Avoidance v. Fair-Sharing TCP throughput under different queue management schemes

Time (secs)	CBT Throughput (KBytes/sec)	FRED Throughput (KBytes/sec)	RED Throughput (KBytes/sec)	FIFO Throughput (KBytes/sec)
0 - 20	~1000	~1000	~1000	~1000
20 - 60 (UDP Bulk Transfer)	~1000	~1000	~300	~200
60 - 100	~1000	~1000	~1000	~1000

- TCP performance as a function of the state required to ensure/approximate fairness

## Queue Management Recommendations

- Recommend (Braden 1998, Floyd 1998)
  - Deploy RED
    - Avoid full queues, reduce latency, reduce packet drops, avoid lock out
  - Continue research into ways to *punish* aggressive or misbehaving flows
- Multimedia
  - Does not use TCP
    - Can tolerate some loss
    - Price for latency is too high
  - Often low-bandwidth
  - Delay sensitive

## Outline

- Problem
  - Supporting multimedia on the Internet
- Context
  - Drop Tail
  - RED
  - FRED
- Approach**
  - CBT
- Evaluation
- Conclusion

## Goals

- Isolation
  - Responsive (TCP) from unresponsive
  - Unresponsive: multimedia from aggressive
- Flexible fairness
  - Something more than equal shares for all
- Lightweight
  - Minimal state per flow
- Maintain benefits of RED
  - Feedback
  - Distribution of drops

## Class-Based Threshold (CBT)

The diagram shows a 'Classifier' block that splits traffic into three paths. Each path leads to a queue with a diamond-shaped threshold indicator. A graph below the queues shows traffic volume over time, with a shaded area indicating congestion. The queues then feed into a single output line.

- Designate a set of traffic classes and allocate a fraction of a router's buffer capacity to each class
- Once a class is occupying its limit of queue elements, discard *all* arriving packets
- Within a traffic class, further active queue management may be performed

## Class-Based Threshold (CBT)

- Isolation
  - Packets are classified into 1 of 3 classes
  - Statistics are kept for each class
- Flexible fairness
  - Configurable thresholds determine the ratios between classes during periods of congestion
- Lightweight
  - State per class and not per flow
  - Still one outbound queue
- Maintain benefits of RED
  - Continue with RED policies for TCP

## CBT Implementation

The diagram shows traffic entering a 'Channel' and being classified into three paths: 'Tagged UDP/UDP', 'Untagged UDP/TCP', and 'TCP'. Each path goes through a 'Threshold Test' block. The 'Tagged UDP/UDP' path has a note 'th = fixed (configured initially)'. The paths then lead to a 'RED' block, which feeds into a 'FIFO Scheduling' block. The output is divided into three queues: 'RED MAX', 'RED AVE', and 'RED MIN'.

- Implemented in Alt-Q on FreeBSD
- Three traffic classes:
  - TCP
  - marked non-TCP ("well behaved UDP")
  - non-marked non-TCP (all others)
- Subject TCP flows get RED and non-TCP flows to a weighted average queue occupancy threshold test

## Class-Based Thresholds Evaluation

The diagram shows a network topology with two routers connected by a central link. Traffic enters from the left and exits to the right. A starburst symbol is placed on the central link to indicate congestion.

- Compare:
  - FIFO queuing (Lower bound baseline)
  - RED (The Internet of tomorrow)
  - FRED (RED + Fair allocation of buffers)
  - CBT
  - CBQ (Upper bound baseline)

## CBT Evaluation Experimental design

The diagram shows a network topology with two routers connected by a central link. Traffic enters from the left and exits to the right. A starburst symbol is placed on the central link to indicate congestion.

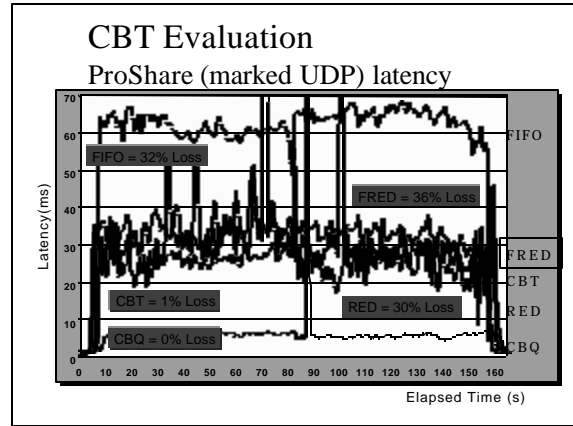

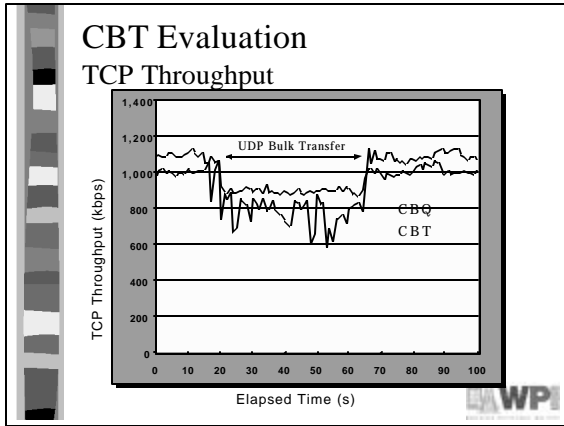

Throughput and Latency

6 ProShare - Unresponsive MM (210Kbps each)  
 30 FTP-TCP  
 1 UDP Host (10Mbps, 1KB)

- RED Settings:
  - qsize = 60 pkts
  - max-th = 30 pkts
  - min-th = 15 pkts
  - qweight = 0.002
  - max-pro = 0.1
- CBT Settings:
  - mm-th = 10 pkts
  - udp-th = 2 pkts

## CBT Evaluation TCP Throughput

The graph plots TCP Throughput (kbps) on the y-axis (0 to 1,400) against Elapsed Time (s) on the x-axis (0 to 100). A horizontal line at approximately 1,100 kbps is labeled 'UDP Bulk Transfer'. Five data series are shown: CBQ, CBT, FRED, RED, and FIFO. CBQ, CBT, and FRED maintain high throughput (around 1,100 kbps) even during the bulk transfer period. RED shows a significant drop in throughput (around 300 kbps) during the bulk transfer. FIFO shows the lowest throughput (around 200 kbps) during the bulk transfer.

- ### Conclusion
- RED/FIFO scheduling not sufficient
    - Aggressive unresponsive flows cause trouble
    - Low bandwidth unresponsive (VoIP) punished
  - CBT provides
    - Benefits of RED for TCP only traffic
    - Isolation of TCP vs. Unresponsive
    - Isolation of Aggressive vs. Low Bandwidth
    - Lightweight overhead
- The WPI logo is in the bottom right corner.

- ### Future Work
- How to pick thresholds?
    - Implies reservation
    - Dynamic adjustments of thresholds (D-CBT)
  - Additional queue management for classes
    - Classes use "Drop Tail" now
  - Extension to other classes
    - Voice
    - Video
- The WPI logo is in the bottom right corner.

- ### Evaluation of Science?
- Category of Paper
  - Science Evaluation (1-10)?
  - Space devoted to Experiments?
- The WPI logo is in the bottom right corner.
