A. The algorithm considers 8 possible alternatives.

B. Alternatives:

1. Join root cluster.

2. Join subcluster

3. Cluster with (1).

4. Cluster with (2).

5. Cluster with (3).

6. Split second node.

- C. The Cobweb/Classit algorithm chooses based on Category Utility, a quadratic loss function that calculates the “goodness” of grouping two particular elements together versus not grouping them together. This allows the algorithm to decide whether a particular choice will lead to greater predictive abilities.
