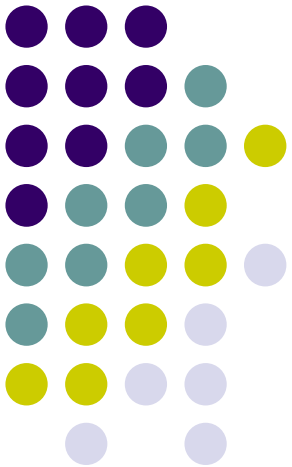
Computer Graphics (CS 4731)
Lecture 23: Viewport Transformation & Hidden Surface Removal

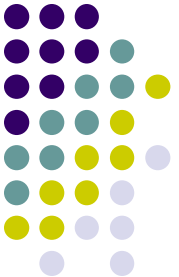
Prof Emmanuel Agu

Computer Science Dept.

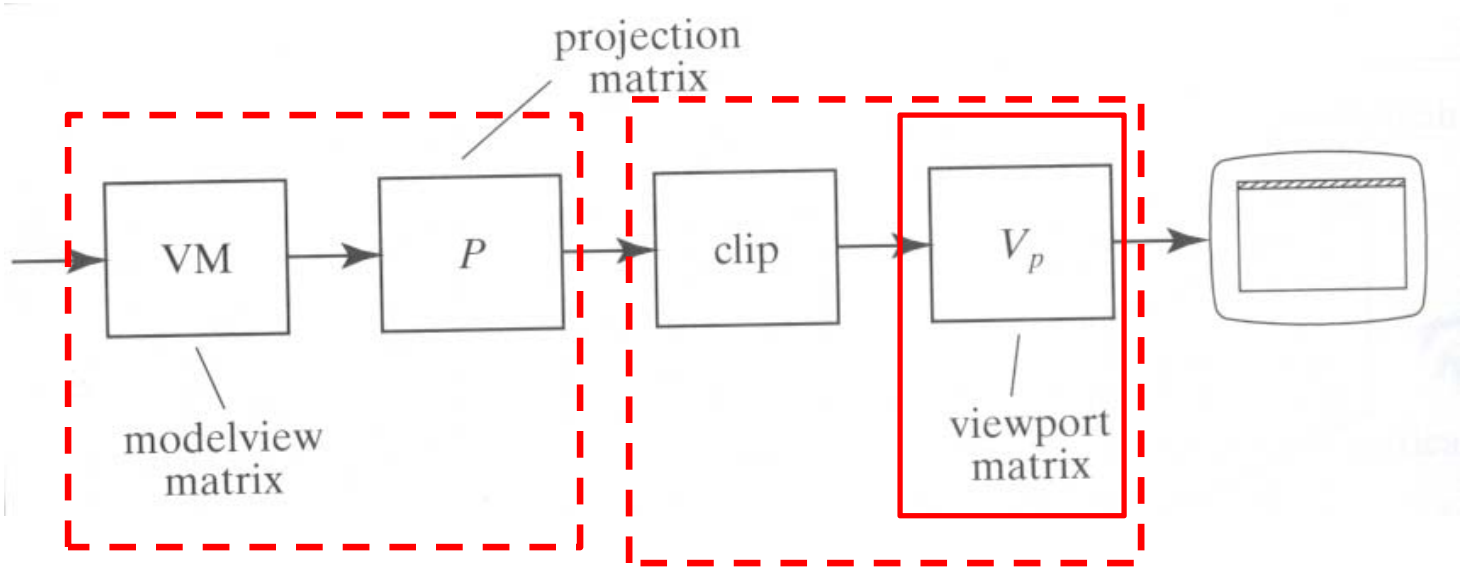
Worcester Polytechnic Institute (WPI)



Viewport Transformation



- After clipping, do viewport transformation

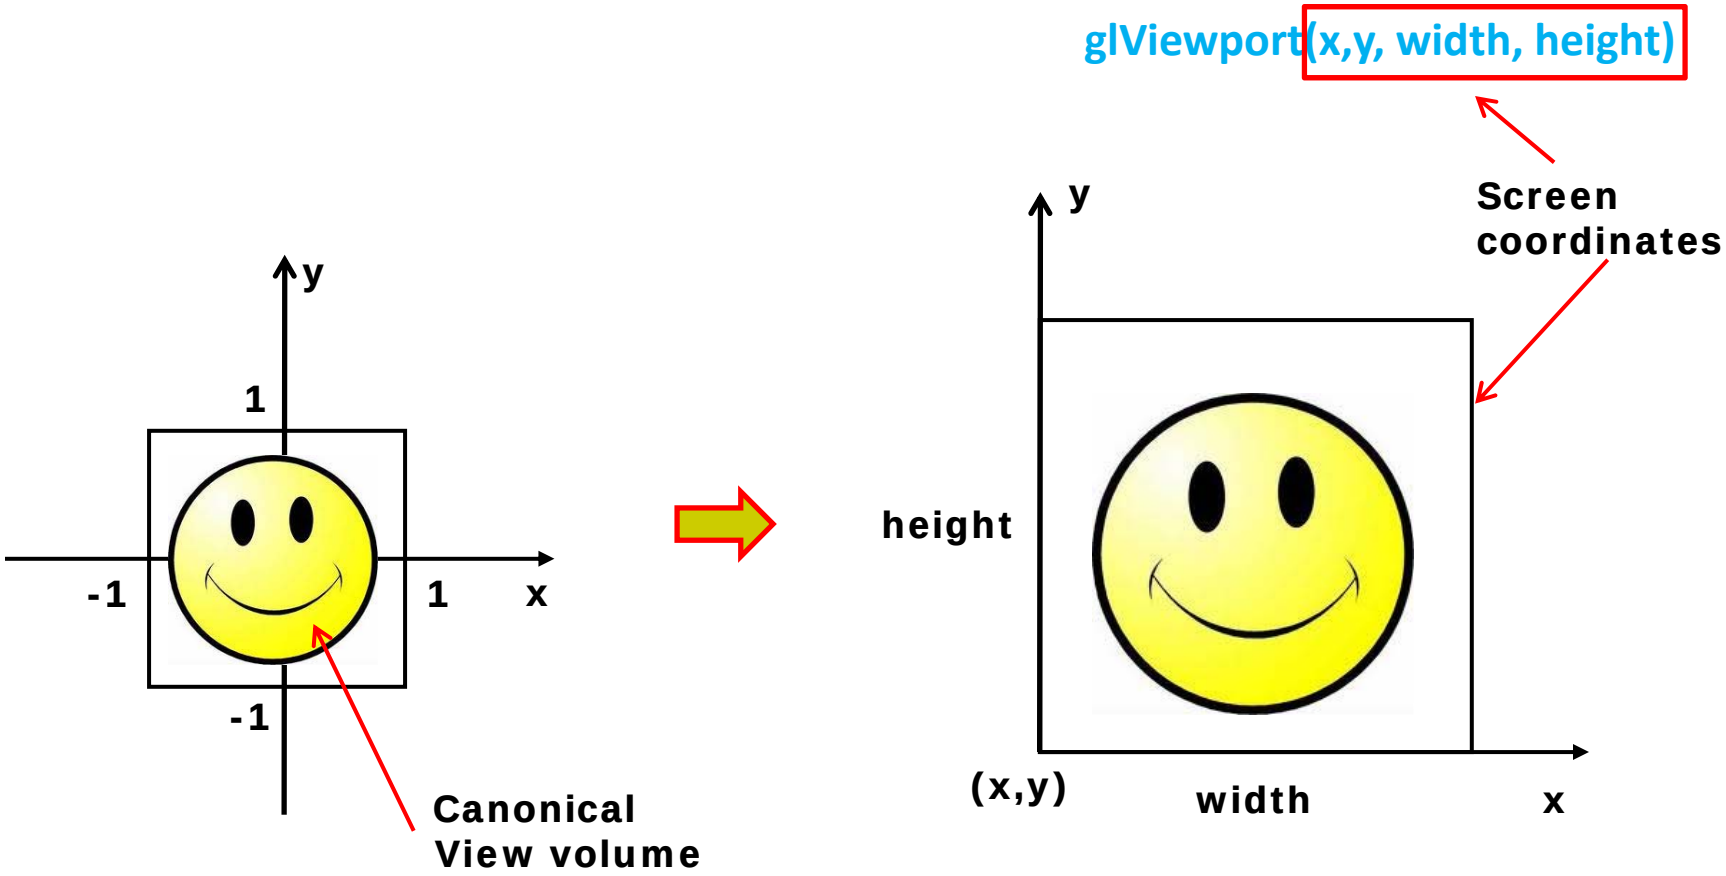


User implements in Vertex shader

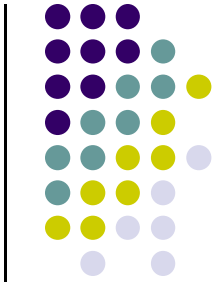
Manufacturer implements In hardware

Viewport Transformation

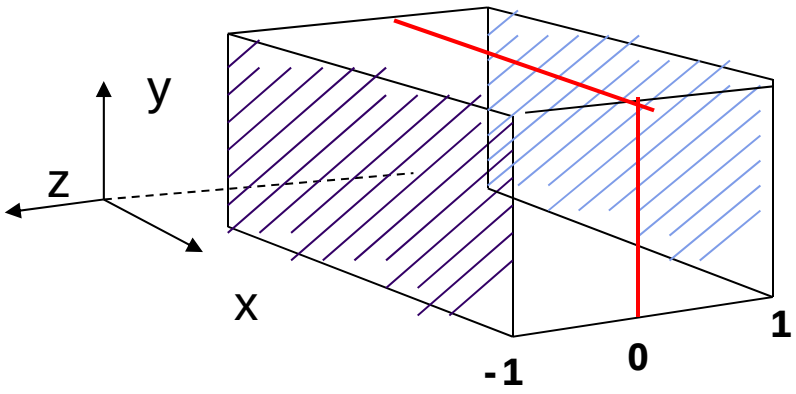
- Maps **CVV (x, y)** -> **screen (x, y)** coordinates



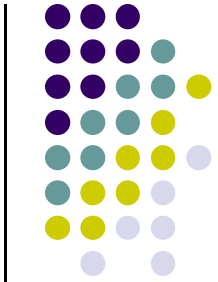
Viewport Transformation: What of z?



- Also maps z (pseudo-depth) from [-1,1] to [0,1]
- [0,1] pseudo-depth stored in depth buffer,
  - Used for Depth testing (Hidden Surface Removal)

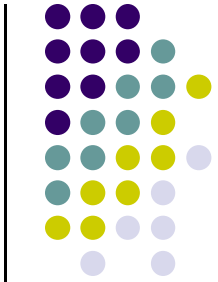


Hidden surface Removal

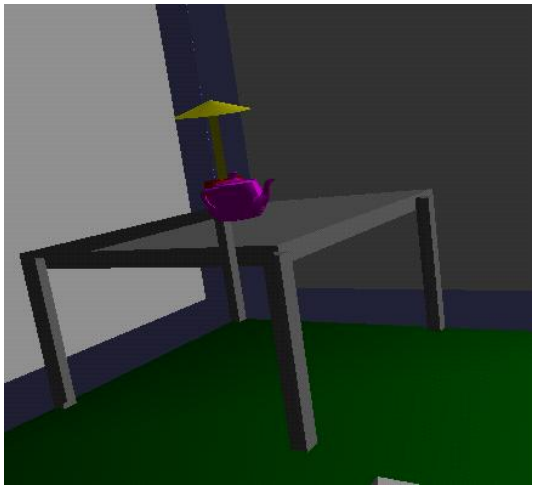


- Drawing polygonal faces on screen consumes CPU cycles
- Cannot see every surface in scene
- To save time, draw only surfaces we see
- Surfaces we cannot see and elimination methods:
  - **Occluded surfaces:** hidden surface removal (visibility)
  - **Back faces:** back face culling
  - **Faces outside view volume:** viewing frustrum culling
- Classes of HSR techniques:
  - **Object space techniques:** applied before rasterization
  - **Image space techniques:** applied after vertices have been rasterized

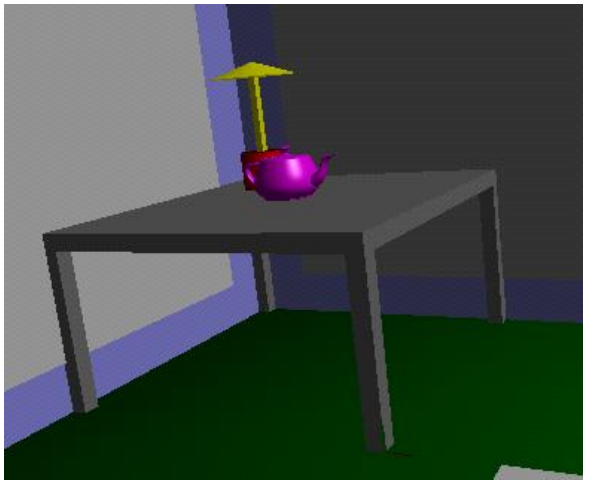
Visibility (hidden surface removal)



- Overlapping opaque polygons
- **Correct visibility?** Draw only the closest polygon
  - (remove the other hidden surfaces)

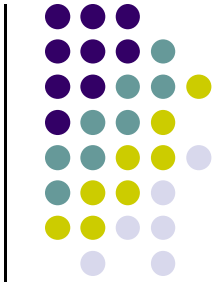


wrong visibility

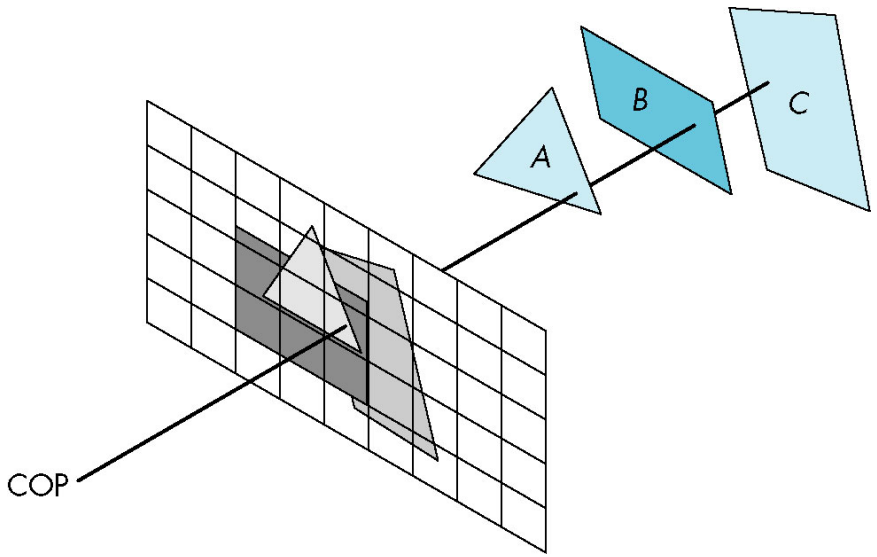


Correct visibility

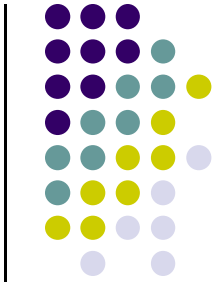
Image Space Approach



- Start from pixel, work backwards into the scene
- Through each pixel, (nm for an n x m frame buffer) find closest of k polygons
- Complexity O(nmk)
- Examples:
  - Ray tracing
  - z-buffer : OpenGL

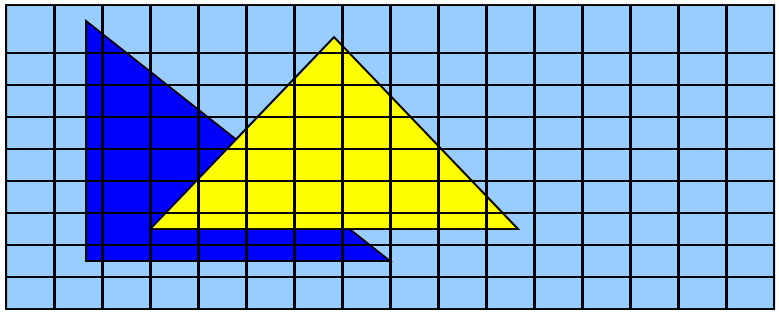


OpenGL - Image Space Approach

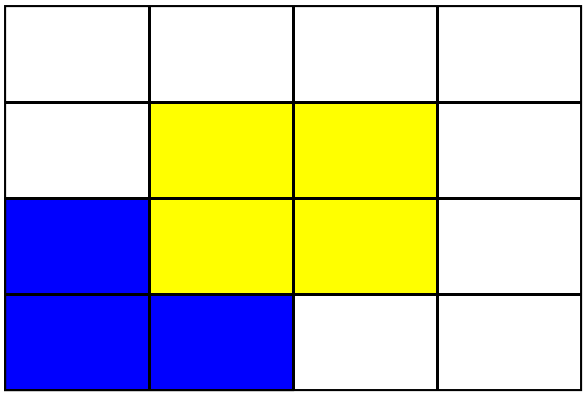


- Paint pixel with color of **closest** object

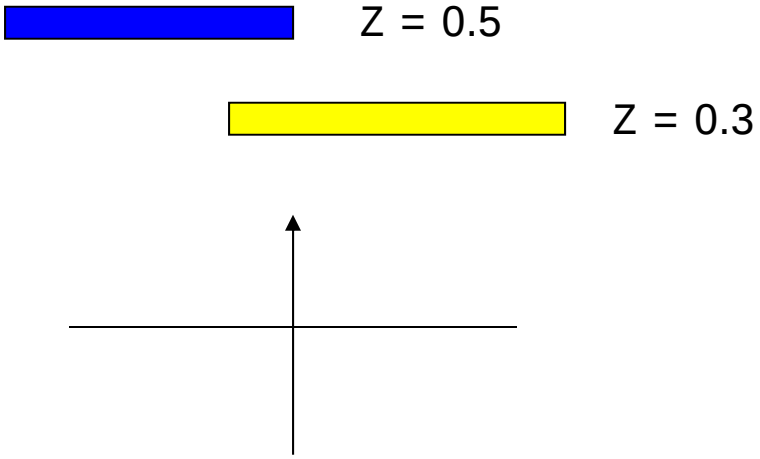
```
for (each pixel in image) {
    determine the object closest to the pixel
    draw the pixel using the object's color
}
```



Z buffer Illustration

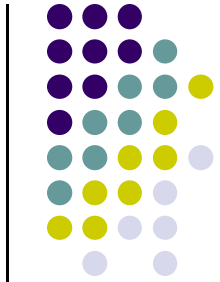


Correct Final image



Top View

Z buffer Illustration

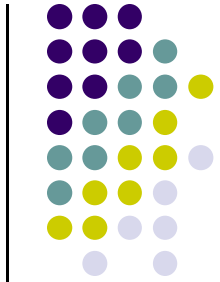


Step 1: Initialize the depth buffer

1.0	1.0	1.0	1.0
1.0	1.0	1.0	1.0
1.0	1.0	1.0	1.0
1.0	1.0	1.0	1.0

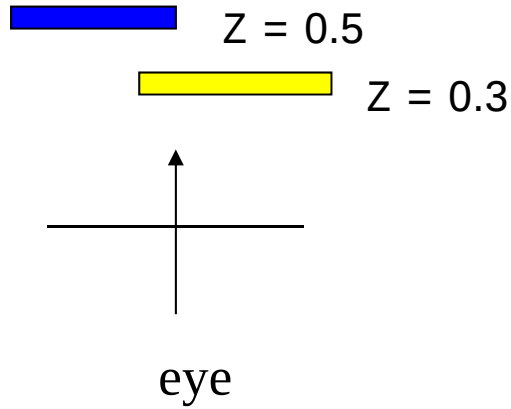
Largest possible
z values is 1.0

Z buffer Illustration



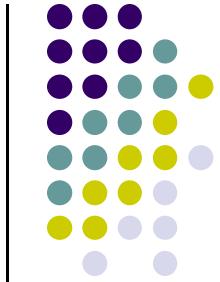
Step 2: Draw blue polygon
(actually order does not affect final result)

1.0	1.0	1.0	1.0
1.0	1.0	1.0	1.0
0.5	0.5	1.0	1.0
0.5	0.5	1.0	1.0



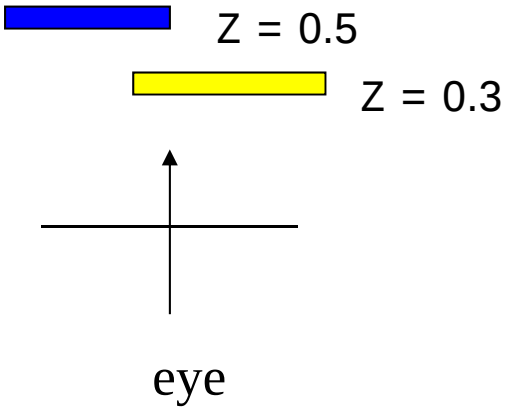
1. Determine group of pixels corresponding to blue polygon
2. Figure out z value of blue polygon for each covered pixel (0.5)
3. For each covered pixel, z = 0.5 is less than 1.0
    1. Smallest z so far = 0.5, color = blue

Z buffer Illustration



Step 3: Draw the yellow polygon

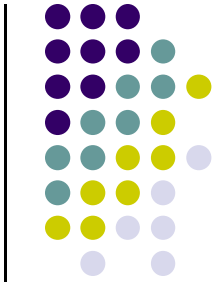
1.0	1.0	1.0	1.0
1.0	0.3	0.3	1.0
0.5	0.3	0.3	1.0
0.5	0.5	1.0	1.0



1. Determine group of pixels corresponding to yellow polygon
2. Figure out z value of yellow polygon for each covered pixel (0.3)
3. For each covered pixel, z = 0.3 becomes minimum, color = yellow

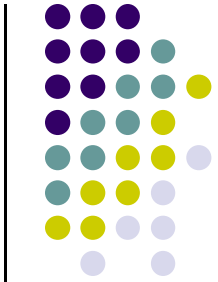
z-buffer drawback: wastes resources drawing and redrawing faces

OpenGL HSR Commands



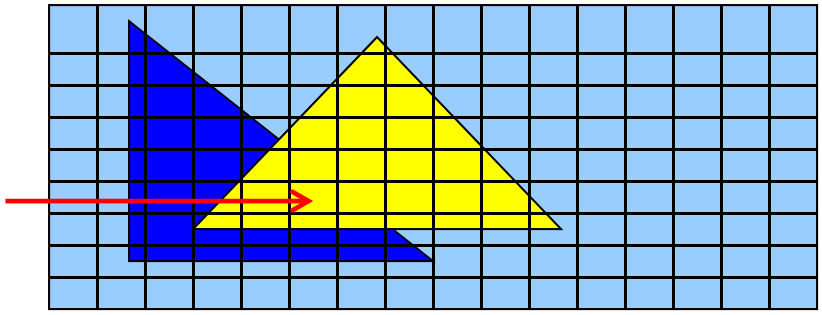
- 3 main commands to do HSR
- **`glutInitDisplayMode(GLUT_DEPTH | GLUT_RGB)`** instructs openGL to create depth buffer
- **`glEnable(GL_DEPTH_TEST)`** enables depth testing
- **`glClear(GL_COLOR_BUFFER_BIT | GL_DEPTH_BUFFER_BIT)`** initializes depth buffer every time we draw a new picture

Z-buffer Algorithm

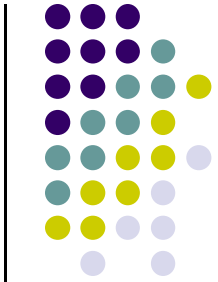


- Initialize every pixel's z value to 1.0
- rasterize every polygon
- For each pixel in polygon, find its z value (interpolate)
- Track smallest z value so far through each pixel
- As we rasterize polygon, for each pixel in polygon
  - If polygon's z through this pixel < current min z through pixel
  - Paint pixel with polygon's color

Find depth (z) of every polygon at each pixel



Z (depth) Buffer Algorithm



Depth of polygon being rasterized at pixel (x, y)

Largest depth seen so far Through pixel (x, y)

```
For  each polygon  {

  for each pixel (x,y) in polygon area  {

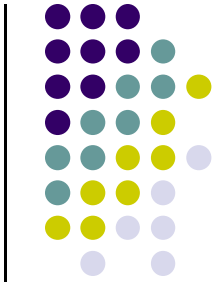
      if  (z_polygon_pixel(x,y) < depth_buffer(x,y) ) {

          depth_buffer(x,y) = z_polygon_pixel(x,y);

          color_buffer(x,y) = polygon color at (x,y)
      }
  }
}
```

Note: know depths at vertices. Interpolate for interior z_polygon_pixel(x, y) depths

Z-Buffer Depth Compression

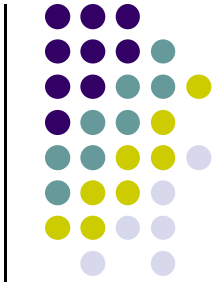


- **Pseudodepth calculation:** Recall that we chose parameters (a and b) to map z from range [near, far] to **pseudodepth** range[-1,1]

$$\begin{pmatrix} \frac{2N}{x\max - x\min} & 0 & \frac{right+left}{right-left} & 0 \\ 0 & \frac{2N}{top-bottom} & \frac{top+bottom}{top-bottom} & 0 \\ 0 & 0 & \frac{-(F+N)}{F-N} & \frac{-2FN}{F-N} \\ 0 & 0 & -1 & 0 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \\ 1 \end{pmatrix}$$

These values map z values of original view volume to [-1, 1] range

Z-Buffer Depth Compression



- This mapping is almost linear close to eye
- Non-linear further from eye, approaches asymptote
- Also limited number of bits
- Thus, two z values close to far plane may map to same pseudodepth: ***Errors!!***
