Step Counting
(How Step Counting Works)
Sedentary Lifestyle

- Sedentary lifestyle
  - Increases risk of diabetes, heart disease, dying earlier, etc
  - Kills more than smoking!!

- Categorization of sedentary lifestyle based on step count by paper:
Step Count Mania

- Everyone is crazy about step count these days
- Pedometer apps, pedometers, fitness trackers, etc
- Tracking makes user aware of activity levels, motivates them to exercise more
How does a Pedometer Detect/Count Steps

Ref: Deepak Ganesan, Ch 2 Designing a Pedometer and Calorie Counter

- As example of processing Accelerometer data
- Walking or running results in motion along the 3 body axes (forward, vertical, side)
- Smartphone has similar axes
  - Alignment depends on phone orientation
The Nature of Walking

Ref: Deepak Ganesan, Ch 2 Designing a Pedometer and Calorie Counter

- Vertical and forward acceleration increases/decreases during different phases of walking
- Walking causes a large periodic spike in one of the accelerometer axes
- Which axes (x, y or z) and magnitude depends on phone orientation
Step Detection Algorithm
Ref: Deepak Ganesan, Ch 2 Designing a Pedometer and Calorie Counter

- **Step 1: smoothing**
  - Signal looks choppy
  - Smooth by replacing each sample with average of current, prior and next sample (Window of 3)

- **Step 2: Dynamic Threshold Detection**
  - Focus on accelerometer axis with largest peak
  - Would like a threshold such that each crossing is a step
  - But cannot assume fixed threshold (magnitude depends on phone orientation)
  - Track min, max values observed every 50 samples
  - Compute *dynamic threshold: (Max + Min)/2*
Step Detection Algorithm
Ref: Deepak Ganesan, Ch 2 Designing a Pedometer and Calorie Counter

- A step is
  - indicated by crossings of dynamic threshold
  - Defined as negative slope (\(\text{sample}_{\text{new}} < \text{sample}_{\text{old}}\)) when smoothed waveform crosses dynamic threshold
Step Detection Algorithms
Ref: Deepak Ganesan, Ch 2 Designing a Pedometer and Calorie Counter

- **Problem**: Vibrations (e.g., mowing lawn, plane taking off) could be counted as a step.
- **Optimization**: Fix by exploiting periodicity of walking/running.
- Assume people can:
  - Run 5 steps per second => 0.2 seconds per step
  - Walk 1 step every 2 seconds => 2 seconds per step
  - So, can eliminate “negative crossings” that occur outside period [0.2 – 2 seconds]
Step Detection Algorithms
Ref: Deepak Ganesan, Ch 2 Designing a Pedometer and Calorie Counter

- Previous step detection algorithm is simple.
- More sophisticated algorithms exist
- Smoothing: Time domain filtering
  - Exponential smoothing: Weight more recent samples higher
  - Median filtering + Exponential smoothing
- Frequency domain processing:
  - Fourier transform, operations in frequency domain
  - Keep frequencies of typical walking, and remove rest
  - Typical walking pace: 2-3Hz (remove freq > 5Hz)
Counting Calories
Ref: Deepak Ganesan, Ch 2 Designing a Pedometer and Calorie Counter

- First, calculate distance covered based on number of steps taken

Distance = number of steps × distance per step (1)

- Distance per step (stride) depends on user’s height (taller people, longer strides)
- Number of steps taken per 2 seconds gives estimate of person’s stride length

<table>
<thead>
<tr>
<th>Steps per 2 s</th>
<th>Stride (m/s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0~2</td>
<td>Height/5</td>
</tr>
<tr>
<td>2~3</td>
<td>Height/4</td>
</tr>
<tr>
<td>3~4</td>
<td>Height/3</td>
</tr>
<tr>
<td>4~5</td>
<td>Height/2</td>
</tr>
<tr>
<td>5~6</td>
<td>Height/1.2</td>
</tr>
<tr>
<td>6~8</td>
<td>Height</td>
</tr>
<tr>
<td>&gt;=8</td>
<td>1.2 × Height</td>
</tr>
</tbody>
</table>
Counting Calories
Ref: Deepak Ganesan, Ch 2 Designing a Pedometer and Calorie Counter

● To estimate speed, remember that speed = distance/time. Thus,

\[ \text{Speed} = \text{steps per 2 s} \times \text{stride/2 s} \] (2)

● Many factors affect calorie expenditure. E.g
  ● Body weight, workout intensity, fitness level, etc

● Rough relationship given in table

<table>
<thead>
<tr>
<th>Running Speed (km/h)</th>
<th>Calories Expended (C/kg/h)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>10</td>
</tr>
<tr>
<td>12</td>
<td>15</td>
</tr>
<tr>
<td>16</td>
<td>20</td>
</tr>
<tr>
<td>20</td>
<td>25</td>
</tr>
</tbody>
</table>

● Expressed as an equation

\[ \text{Calories (C/kg/h)} = 1.25 \times \text{running speed (km/h)} \] (3)

● Converting from speed in km/h to m/s

\[ \text{Calories (C/kg/h)} = 1.25 \times \text{speed (m/s)} \times \frac{3600}{1000} = 4.5 \times \text{speed (m/s)} \] (4)
Introduction to Activity Recognition
Activity Recognition

- **Goal:** Want our app to detect what activity the user is doing?
- **Classification task:** which of these 6 activities is user doing?
  - Walking,
  - Jogging,
  - Ascending stairs,
  - Descending stairs,
  - Sitting,
  - Standing

- Typically, use machine learning classifiers to classify user’s accelerometer signals
Activity Recognition Overview

Gather Accelerometer data

Machine Learning Classifier

Walking

Running

Climbing Stairs
Example Accelerometer Data for Activities

(a) Walking

(b) Jogging

(e) Sitting

(f) Standing
Example Accelerometer Data for Activities

(c) Ascending Stairs

(d) Descending Stairs
Activity Recognition
Using Google API
Activity Recognition

- Activity Recognition? Detect what user is doing?
  - Part of user’s context
- Examples: sitting, running, driving, walking
- Why? App can adapt it’s behavior based on user behavior
- **E.g.** If user is driving, don’t send notifications

https://www.youtube.com/watch?v=S8sugXgUVEI
Google Activity Recognition API

- API to detect smartphone user’s current activity
- Programmable, can be used by your Android app
- Currently detects 6 states:
  - In vehicle
  - On Bicycle
  - On Foot
  - Still
  - Tilting
  - Unknown
Google Activity Recognition API

- Deployed as part of Google Play Services
Google Activity Recognition can:

- Recognize user’s current activity (Running, walking, in a vehicle or still)

Project Setup:

- Create Android Studio project with blank Activity (minimum SDK 14)
- In `build.gradle` file, define latest Google Play services (was 8.4 last year, now 11.5.9) as dependency

```java
compile 'com.google.android.gms:play-services:8.4.0'
```
Activity Recognition Using AR API

Ref: How to Recognize User Activity with Activity Recognition by Paul Trebilcox-Ruiz on Tutsplus.com tutorials

- Create new class `ActivityRecognizedService` which extends `IntentService`
- **IntentService**: type of service, asynchronously handles work off main thread as Intent requests.
- Throughout user’s day, **Activity Recognition API** sends user’s activity to this IntentService in the background
- Need to program this Intent to handle incoming user activity

```java
public class ActivityRecognizedService extends IntentService {
    public ActivityRecognizedService() {
        super("ActivityRecognizedService");
    }

    public ActivityRecognizedService(String name) {
        super(name);
    }

    @Override
    protected void onHandleIntent(Intent intent) {
    }
}
```

Called by Android OS to deliver User’s activity
Activity Recognition Using AR API

Ref: How to Recognize User Activity with Activity Recognition by Paul Trebilcox-Ruiz on Tutsplus.com tutorials

- Modify AndroidManifest.xml to
  - Declare ActivityRecognizedService
  - Add com.google.android.gms.permission.ACTIVITY_RECOGNITION permission

```xml
<?xml version="1.0" encoding="utf-8"?>
<manifest xmlns:android="http://schemas.android.com/apk/res/android"
    package="com.tutsplus.activityrecognition">
    <application>
        <uses-permission android:name="com.google.android.gms.permission.ACTIVITY_RECOGNITION" />
        <activity android:name=".MainActivity">
            <intent-filter>
                <action android:name="android.intent.action.MAIN" />
                <category android:name="android.intent.category.LAUNCHER" />
            </intent-filter>
        </activity>
        <service android:name=".ActivityRecognizedService" />
    </application>
</manifest>
```
Requesting Activity Recognition

- In `MainActivity.java`, To connect to Google Play Services:
  - Provide `GoogleApiClient` variable type + implement callbacks

```java
public class MainActivity extends AppCompatActivity implements GoogleApiClient.ConnectionCallbacks,
                         GoogleApiClient.OnConnectionFailedListener {
    public GoogleApiClient mApiClient;      // Handle to Google Activity Recognition client

    @Override
    protected void onCreate(Bundle savedInstanceState) {
        super.onCreate(savedInstanceState);
        setContentView(R.layout.activity_main);
    }

    @Override
    public void onConnected(@Nullable Bundle bundle) {  // Normal AR call if everything working well
        }

    @Override
    public void onConnectionSuspended(int i) {      // Called if sensor (accelerometer) connection fails
        }

    @Override
    public void onConnectionFailed(@NonNull ConnectionResult connectionResult) {  // Called if Google Play connection fails
        }
```
Requesting Activity Recognition

- In `onCreate`, initialize client and connect to Google Play Services

```java
@Override
protected void onCreate(Bundle savedInstanceState) {
    super.onCreate(savedInstanceState);
    setContentView(R.layout.activity_main);

    mApiClient = new GoogleApiClient.Builder(this)
        .addApi(ActivityRecognition.API)
        .addConnectionCallbacks(this)
        .addOnConnectionFailedListener(this)
        .build();

    mApiClient.connect();
```
Requesting Activity Recognition

- Once `GoogleApiClient` has connected, `onConnected()` is called
- Need to create a `PendingIntent` that goes to our `IntentService`
- Also set how often API should check user’s activity in milliseconds

```java
@override
public void onConnected(@Nullable Bundle bundle) {
    Intent intent = new Intent(this, ActivityRecognizedService.class);
    PendingIntent pendingIntent = PendingIntent.getService(this, 0, intent,
                                                       PendingIntent.FLAG_UPDATE_CURRENT);
    ActivityRecognition.ActivityRecognitionApi.requestActivityUpdates(
        mApiClient, 3000, pendingIntent);
}
```
Handling Activity Recognition

- Our app tries to recognize the user’s activity every 3 seconds
- `onHandleIntent` called every 3 seconds, Intent delivered
- In `onHandleIntent()` method of `ActivityRecognizedService`
  - Extract `ActivityRecognitionResult` from the Intent
  - Retrieve list of possible activities by calling `getProbableActivities()` on `ActivityRecognitionResult` object

```java
@Override
protected void onHandleIntent(Intent intent) {
    if (ActivityRecognitionResult.hasResult(intent)) {
        ActivityRecognitionResult result = ActivityRecognitionResult.extractResult(intent);
        handleDetectedActivities(result.getProbableActivities());
    }
}
```

Called to deliver user’s activity as an Intent

Extract Activity Recognition object from Intent

Get list of probable activities
Handling Activity Recognition

- Simply log each detected activity and display how confident Google Play services is that user is performing this activity.

```java
private void handleDetectedActivities(List<DetectedActivity> probableActivities) {
    for (DetectedActivity activity : probableActivities) {
        switch (activity.getType()) {
            case DetectedActivity.IN_VEHICLE:
                Log.e("ActivityRecogition", "In Vehicle: " + activity.getConfidence());
                break;
            case DetectedActivity.ON_BICYCLE:
                Log.e("ActivityRecogition", "On Bicycle: " + activity.getConfidence());
                break;
            case DetectedActivity.ON_FOOT:
                Log.e("ActivityRecogition", "On Foot: " + activity.getConfidence());
                break;
            case DetectedActivity.RUNNING:
                Log.e("ActivityRecogition", "Running: " + activity.getConfidence());
                break;
            case DetectedActivity.STILL:
                Log.e("ActivityRecogition", "Still: " + activity.getConfidence());
                break;
            case DetectedActivity.TILTING:
                Log.e("ActivityRecogition", "Tilting: " + activity.getConfidence());
                break;
        }
    }
}
```

Sample output:

```
1   E/ActivityRecognition: On Foot: 92
2   E/ActivityRecognition: Running: 87
3   E/ActivityRecognition: On Bicycle: 8
4   E/ActivityRecognition: Walking: 5
```
Handling Activity Recognition

- If confidence is > 75, activity detection is probably accurate
- If user is walking, ask “Are you walking?”

```java
case DetectedActivity.WALKING: {
    Log.e( "ActivityRecognition", "Walking: " + activity.getConfidence() );
    if( activity.getConfidence() >= 75 ) {
        NotificationCompat.Builder builder = new NotificationCompat.Builder(this);
        builder.setContentText( "Are you walking?" );
        builder.setSmallIcon( R.mipmap.ic_launcher );
        builder.setContentTitle( getString( R.string.app_name ) );
        NotificationManagerCompat.from( this).notify(0, builder.build());
    }
    break;
}

case DetectedActivity.UNKNOWN: {
    Log.e( "ActivityRecognition", "Unknown: " + activity.getConfidence() );
    break;
}
```
Sample Output of Program

- Sample displayed on development console

<table>
<thead>
<tr>
<th></th>
<th>E/ActivityRecognition: On Foot: 92</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>E/ActivityRecognition: Running: 87</td>
</tr>
<tr>

Quiz 3
Quiz 3

- Quiz in class next Thursday (before class Oct 12)
- Short answer questions
- Try to focus on understanding, not memorization
- Covers:
  - Lecture slides for lectures 5a, 5b, 6a, 6b
  - 1 code example from book
    - **HFAD examples:** Odometer (Distance Travelled), Ch 13. pg 541
