About Me
A Little about me

- WPI Computer Science Professor
- Research interests:
  - mobile computing especially mobile health, computer graphics
- Started working in mobile computing, wireless in grad school
- CS + ECE background (Hardware + software)
- Current active research: Mobile health apps
  - E.g: AlcoGait app to detect how drunk Smartphone owner is
    - https://www.youtube.com/watch?v=pwZaoKmfq8c
Administrivia
Administrivia: Schedule

- **Week 1-8:** I will introduce class, concepts, Android (Students: Android programming, assigned projects)
  - **Goal:** Students acquire basic Android programming skills to do excellent project
  - Programming apps that use mobile & ubicomp components
- **Week 9:** Students will present final project proposal
- **Week 9-14:** Students work on final project
- **Week 11:** Students present on new mobile APIs, components
  - E.g. machine learning in Android, Augmented Reality
- **Week 14:** Students present + submit final projects
- Quizzes (5) throughout
Requirements to get a Grade

- **Grading policy:**
  - Presentation 15%, Assigned Projects 35%, Final project: 30%, Quizzes: 20%

- **Final project phases:** (See class website for deadlines)
  1. Pick partners, form project groups of 5 members
  2. Submit 1-slide of proposed idea (problem + envisioned solution)
  3. Present project proposal
     - plus submit proposal (intro + related work + methodology/design + proposed project plan)
  4. Build app, evaluate, experiment, analyze results
  5. Present results + submit final paper (in week 14)

- **New final project aspect this offering:**
  - Points for degree of difficulty of project
Course Texts

- **Android Texts:**
  - *Head First Android Dev, (2nd ed)*, Dawn and David Griffiths, O'Reilly, 2017

- Will also use official Google Android documentation
- Learn from research papers: Why not text?
Grader

Will be hired later
Class in 2 Halves

- 2 Halves: About 1 hour 15 mins each half
- Break of about 15 mins
- Talk to me at the end of class NOT during break
  - I need a break too
Poll Question

How many students:

1. **Own** recent Android phones (running Android 4.4, 5, 6, 7, 8 or 9?)

2. **Can borrow** Android phones for projects (e.g. from friend/spouse)?

3. **Do not own and cannot borrow** Android phones for projects?
Mobile Devices
Mobile Devices

- Smart phones (Blackberry, iPhone, Android, etc)
- Tablets (iPad, etc)
- Laptops
- Smartwatches
SmartPhone Hardware

- **Smart** = Communication + Computing + Sensors
  - **Communication**: Talk, SMS, chat, Internet access
  - **Computing**: Java apps, JVM, apps
    - Powerful processors: Quad core CPUs, GPUs
  - **Sensors**: Camera, video, location, temperature, heart rate sensor, etc

- Google Pixel XL phone: Quad core 1.6 GHz Snapdragon CPU, Adreno 530 GPU, 4GB RAM
  - A PC in your pocket!!
  - Multi-core CPU, GPU
  - Runs OpenGL ES, OpenCL and now Deep learning (Tensorflow)
Smartphone Sensors

- Typical smartphone sensors today
  - accelerometer, compass, GPS, microphone, camera, proximity
- Can sense physical world, inputs to intelligent sensing apps
  - E.g. Automatically turn off smartphone ringer when user walks into a class
Growth of Smartphone Sensors

- Every generation of smartphone has more and more sensors!!

Future sensors?
- Complex activity sensor,
- Pollution sensor,
- etc
Wireless Networks
Wireless Network Types

- **Wi-Fi (802.11):** (e.g. Starbucks Wi-Fi)
- **Cellular networks:** (e.g. Sprint network)
- **Bluetooth:** (e.g. car headset)
- **Near Field Communications (NFC)**
  
  - e.g. Mobile pay: swipe phone at dunkin donut
## Wireless Networks Comparison

<table>
<thead>
<tr>
<th>Network Type</th>
<th>Speed</th>
<th>Range</th>
<th>Power</th>
<th>Common Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>WLAN</td>
<td>600 Mbps</td>
<td>45 m – 90 m</td>
<td>100 mW</td>
<td>Internet.</td>
</tr>
<tr>
<td>LTE (4G)</td>
<td>5-12 Mbps</td>
<td>35 km</td>
<td>120 – 300 mW</td>
<td>Mobile Internet</td>
</tr>
<tr>
<td>3G</td>
<td>2 Mbps</td>
<td>35 km</td>
<td>3 mW</td>
<td>Mobile Internet</td>
</tr>
<tr>
<td>Bluetooth</td>
<td>1 – 3 Mbps</td>
<td>100 m</td>
<td>1 W</td>
<td>Headsets, audio streaming.</td>
</tr>
<tr>
<td>Bluetooth LE</td>
<td>1 Mbps</td>
<td>100+ m</td>
<td>.01–.5 W</td>
<td>Wearables, fitness.</td>
</tr>
<tr>
<td>NFC</td>
<td>400 kbps</td>
<td>20 cm</td>
<td>200 mW</td>
<td>Mobile Payments</td>
</tr>
</tbody>
</table>

Different speeds, range, power, uses, etc
Mobile Computing
mobile

adjective
/'mɒbəl, 'mə bɪl/

1. able to move or be moved freely or easily.
   "he has a major weight problem and is not very mobile"
   synonyms: able to move (around), moving, walking; motile; ambulant
Mobile Computing

- Human computes while moving
  - Continuous network connectivity,
  - Points of connection (e.g. cell towers, WiFi access point) might change

- **Note:** Human initiates all activity, (e.g launches apps)

- Wireless Network is **passive**

- **Example:** Using *foursquare.com* on Smartphone
Related Concept: Location-Awareness

- Mobile computing = computing while location changes
- **Location-aware**: Location must be one of app/program’s inputs
- Different user location = different output (e.g. maps)
- **E.g.** User in California gets different map from user in Boston
Location-Aware Example

- Location-aware app must have different behavior/output for different locations
- Example: Mobile yelp
  - **Example search:** Find Indian restaurant
  - App checks user’s location
  - Indian restaurants **close to user’s location** are returned
Example of Truly Mobile App: Word Lens

- Translates signs in foreign Language
- Location-dependent because location of sign, language? varies
Some Mobile apps are not Location-Aware

- If output does not change as location changes, not location-aware
- Apps run on mobile phone **just for convenience**
- Examples:

  - Distinction can be fuzzy. E.g. Banking app may display nearest locations

![Mobile banking app](image1)

![Diet recording app](image2)
Which of these apps are Location-Aware?

a. Yahoo mail mobile
b. Uber app
Mobile Device Issue: Energy Efficiency

- Most resources increasing exponentially except battery energy (ref. Starner, IEEE Pervasive Computing, Dec 2003)

- Some energy saving strategies:
  - **Energy harvesting:** Energy from vibrations, charging mats, moving humans
  - **Scale content:** Reduce image, video resolutions to save energy
  - **Auto-dimming:** Dim screen whenever user not using it. E.g. talking on phone
  - **Better user interface:** Estimate and inform user how long each task will take
    - E.g: At current battery level, you can either type your paper for 45 mins, watch video for 20 mins, etc
ubiquitous
/yooˈbikwɪtəs/

adjective

present, appearing, or found everywhere.
"his ubiquitous influence was felt by all the family"
synonyms: omnipresent, ever-present, everywhere, all over the place, pervasive,
Ubiquitous Computing

- Collection of *active* specialized assistants to assist human in tasks (reminders, personal assistant, staying healthy, school, etc)
- App figures out user’s current state, intent, assists them
- **How?** array of *active* elements, sensors, software, Artificial intelligence
- Extends *mobile computing* and *distributed systems* (more later)
- **Note:** System/app initiates activities, has intelligence
- **Example:** Google Assistant, feed informs user of
  - Driving time to work, home
  - News articles user will like
  - Weather
  - Favorite sports team scores, etc
- Also supports 2-way conversations
User Context

- Imagine a genie/personal assistant who wants to give you all the “right information” at the right time
  - Without asking you any questions
- Examples:
  - Detect traffic ahead, suggest alternate route
  - Bored user, suggest exciting video, etc
- Genie/personal assistant needs to passively detect user’s:
  - Current situation (Context)
  - Intention/plan
Ubicomp Senses User’s Context

- Context?
  - *Human*: motion, mood, identity, gesture
  - *Environment*: temperature, sound, humidity, location
  - *Computing Resources*: Hard disk space, memory, bandwidth
  - *Ubicomp example*:
    - *Assistant senses*: Temperature outside is 10F (environment sensing) + Human plans to go work (schedule)
    - *Ubicomp assistant advises*: Dress warm!

- Sensed environment + Human + Computer resources = *Context*

- *Context-Aware* applications adapt their behavior to context
Sensing the Human

- Environmental sensing is relatively straight-forward
  - Use specialized sensors for temperature, humidity, pressure, etc

- Human sensing is a little harder (ranked easy to hard)
  - **When**: time (Easiest)
  - **Where**: location
  - **Who**: Identification
  - **How**: (Mood) happy, sad, bored (gesture recognition)
  - **What**: eating, cooking (meta task)
  - **Why**: reason for actions (extremely hard!)

- Human sensing (gesture, mood, etc) easiest using cameras

- Research in ubiquitous computing integrates
  - location sensing, user identification, emotion sensing, gesture recognition, activity sensing, user intent
Sensor

- **Example**: E.g. door senses only human motion, opens
- **Sensor**: device that can sense physical world, programmable, multi-functional for various tasks (movement, temperature, humidity, pressure, etc)
- Device that can take inputs from physical word
  - Also includes camera, microphone, etc
- Ubicomp uses data from sensors in phone, wearables (e.g. clothes), appliances, etc.

RFID tags  
Tiny Mote Sensor, UC Berkeley
Ubiquitous Computing: Wearables
remote patient monitoring

Jovanov et. al, “Stress Monitoring...”,
IEEE Engineering in Medicine and Biology Mag. May/June 2003
UbiComp: Wearables, BlueTooth Devices

Body Worn Activity Trackers

External sources of data for smartphone
Definitions: Portable, mobile & ubiquitous computing
Distributed Computing

- Computer system is physically distributed
- User can access system/network from various points.
- E.g. Unix cluster, WWW
- Huge 70's revolution

**Distributed computing example:**
- WPI students have a CCC account
- Log into CCC machines,
- Web surfing from different terminals on campus (library, dorm room, zoolab, etc).

**Finer points:** network is fixed, Human moves
Portable (Nomadic) Computing

- **Basic idea:**
  - Network is fixed
  - device moves and changes point of attachment
  - No computing while moving

- **Portable (nomadic) computing example:**
  - Mary owns a laptop
  - Plugs into her home network,
  - **At home:** surfs web while watching TV.
  - Every morning, brings laptop to school, plug into WPI network, boot up!
  - No computing while traveling to school
Mobile Computing Example

- Continuous computing/network access while moving, automatic reconnection

**Mobile computing example:**
- John has SPRINT PCS phone with web access, voice, SMS messaging.
- He runs apps like facebook and foursquare, continuously connected while walking around Boston

**Finer points:**
- John and mobile users move
- Network deals with changing node location, disconnection/reconnection to different cell towers
Ubiquitous Computing Example

- **Ubiquitous computing**: John is leaving home to go and meet his friends. While passing the fridge, the fridge sends a message to his shoe that milk is almost finished. When John is passing grocery store, shoe sends message to glasses which displays “BUY milk” message. John buys milk, goes home.

- **Core idea**: ubiquitous computing assistants **actively** help John.
SmartPhone Sensing
Smartphone Sensing

- Smartphone used to sense human, environment

  *Example:* Human activity sensing (e.g. walking, driving, climbing stairs, sitting, lying down)

  *Example 2:* Waze crowdsourced traffic
Sensor Processing

- **Machine learning** commonly used to process sensor data
  - Action to be inferred is hand-labelled to generate training data
  - Sensor data is mined for combinations of sensor readings corresponding to action
- Example: Smartphone detects user’s activity (e.g. walking, running, sitting,) by classifying accelerometer sensor data
What Can We Detect/Infer using These Sensors

Smartphone Sensing!!
Internet of Things (IoT)
Internet of Things

- Internet extended to connect Devices
IoT: Networked Smart Things (Devices)

- Smart things: Can be accessed, controlled over the network, learns users patterns

Nest Smart thermostat
- Learns owners manual settings
- Turns down heat when not around

Smart Fridge
- See groceries in fridge from anywhere
Other Ubicomp Systems

- **Smart Homes:** Continuously monitors elders who live in smart home, automatically dials 911 if elder ill, fall
  - Falls kill many old people who live alone

- **Smart buildings:** Senses presence of people, ambient temperature, people flow, dynamically adjusts heating/cooling
  - Can save over 40% of energy bill

- **Smart Cities:** Real time data from Sensors embedded in street used to direct drivers to empty parking spots
  - About 30% of traffic jam caused by people hunting for parking
