Sphere Environment Map

- Cube can be replaced by a sphere (sphere map)
Sphere Mapping

- Original environmental mapping technique
- Proposed by Blinn and Newell
- Map longitude and latitude to texture coordinates
- OpenGL supports sphere mapping
- Requires a circular texture map equivalent to an image taken with a fisheye lens
Sphere Map

- A sphere map is basically a photograph of a reflective sphere in an environment

Paul DeBevec, www.debevec.org
Sphere map

- example

Sphere map (texture)

Sphere map applied on torus
Capturing a Sphere Map

Matt Loper, MERL
Viewport Transformation
Viewport Transformation

- After projection, clipping, do viewport transformation

User implements in Vertex shader

Manufacturer implements in hardware
Viewport Transformation

- Maps \( \text{CVV} (x, y) \) -> screen \((x, y)\) coordinates

\[
\text{glViewport}(x, y, \text{width}, \text{height})
\]
Viewport Transformation: What of z?

- Also maps z (pseudo-depth) from [-1,1] to [0,1]
- [0,1] pseudo-depth stored in depth buffer,
  - Used for Depth testing (Hidden Surface Removal)
Hidden Surface Removal
Rasterization

- Rasterization generates set of **fragments**
- Implemented by graphics hardware
- Rasterization algorithms for primitives (e.g. lines, circles, triangles, polygons)

### Rasterization: Determine Pixels (fragments) each primitive covers
Hidden surface Removal

- Drawing polygonal faces on screen consumes CPU cycles
- User cannot see every surface in scene
- To save time, draw only surfaces we see
- Surfaces we cannot see and elimination methods?

1. **Occluded surfaces**: hidden surface removal (visibility)
2. **Back faces**: back face culling
Hidden surface Removal

- Surfaces we cannot see and elimination methods:
  - 3. Faces outside view volume: viewing frustrum culling

Classes of HSR techniques:
- **Object space techniques**: applied before rasterization
- **Image space techniques**: applied after vertices have been rasterized
Visibility (hidden surface removal)

- Overlapping opaque polygons
- **Correct visibility?** Draw only the closest polygon
  - (remove the other hidden surfaces)

wrong visibility

Correct visibility
Image Space Approach

- Start from pixel, work backwards into the scene
- Through each pixel, \((nm\text{ for an } n \times m \text{ frame buffer})\) find closest of \(k\) polygons
- Complexity \(O(nmk)\)
- Examples:
  - Ray tracing
  - z-buffer : OpenGL
OpenGL - Image Space Approach

- Paint pixel with color of closest object

for (each pixel in image) {
   determine the object closest to the pixel
   draw the pixel using the object’s color
}

![Image of pixel painting process]
Z buffer Illustration

Correct Final image

Top View

eye

Z = 0.3

Z = 0.5
Z buffer Illustration

Step 1: Initialize the depth buffer

Largest possible z values is 1.0
Z buffer Illustration

**Step 2:** Draw blue polygon
(actually order does not affect final result)

1. Determine group of pixels corresponding to blue polygon
2. Figure out z value of blue polygon for each covered pixel (0.5)
3. For each covered pixel, z = 0.5 is less than 1.0
   1. Smallest z so far = 0.5, color = blue
Z buffer Illustration

**Step 3:** Draw the yellow polygon

1. Determine group of pixels corresponding to yellow polygon
2. Figure out z value of yellow polygon for each covered pixel (0.3)
3. For each covered pixel, $z = 0.3$ becomes minimum, color = yellow

**z-buffer drawback:** wastes resources drawing and redrawing faces
OpenGL HSR Commands

- 3 main commands to do HSR

- `glutInitDisplayMode(GLUT_DEPTH | GLUT_RGB)` instructs OpenGL to create depth buffer

- `glEnable(GL_DEPTH_TEST)` enables depth testing

- `glClear(GL_COLOR_BUFFER_BIT | GL_DEPTH_BUFFER_BIT)` initializes depth buffer every time we draw a new picture
Z-buffer Algorithm

- Initialize every pixel’s z value to 1.0
- Rasterize every polygon
- For each pixel in polygon, find its z value (interpolate)
- Track smallest z value so far through each pixel
- As we rasterize polygon, for each pixel in polygon
  - If polygon’s z through this pixel < current min z through pixel
  - Paint pixel with polygon’s color

Find depth (z) of every polygon at each pixel
Z (depth) Buffer Algorithm

Depth of polygon being rasterized at pixel \((x, y)\)  

Largest depth seen so far through pixel \((x, y)\)

For each polygon \{

for each pixel \((x,y)\) in polygon area \{

if \((z\textunderscore polygon\_pixel}(x,y) < depth\_buffer(x,y)\) \{

\[
\text{depth\_buffer}(x,y) = z\textunderscore polygon\_pixel(x,y);
\]

\[
\text{color\_buffer}(x,y) = \text{polygon color at } (x,y)
\]

\}

\}

Note: know depths at vertices. Interpolate for interior \(z\textunderscore polygon\_pixel(x, y)\) depths
Can combine shading and hsr through scan line algorithm

```c
for(int y = ybott; y <= ytop; y++) // for each scan line
{
    for(each polygon){
        find xleft and xright
        find dleft, dright, and dinc
        find colorleft and colorright, and colorinc
        for(int x = xleft, c = colorleft, d = dleft; x <= xright;
            x++, c+= colorinc, d+= dinc)
            if(d < d[x][y])
                { put c into the pixel at (x, y)
                    d[x][y] = d; // update closest depth
                }
    }
}
```
Perspective Transformation: Z-Buffer Depth Compression

- **Pseudodepth calculation**: Recall we chose parameters (a and b) to map z from range \([\text{near}, \text{far}]\) to pseudodepth range\([-1,1]\)

These values map z values of original view volume to \([-1, 1]\) range
Z-Buffer Depth Compression

- This mapping is almost linear close to eye
- Non-linear further from eye, approaches asymptote
- Also limited number of bits
- Thus, two z values close to far plane may map to same pseudodepth: **Errors!!**
Painter’s HSR Algorithm

- Render polygons farthest to nearest
- Similar to painter layers oil paint

Viewer sees B behind A

Render B then A
Depth Sort

- Requires sorting polygons (based on depth)
  - $O(n \log n)$ complexity to sort $n$ polygon depths
  - Not every polygon is clearly in front or behind other polygons

Polygons sorted by distance from COP
Easy Cases

- **Case a:** A lies behind all polygons

- **Case b:** Polygons overlap in z but not in x or y
Hard Cases

Overlap in \((x,y)\) and \(z\) ranges

cyclic overlap

penetration
Back Face Culling

- **Back faces**: faces of opaque object that are “pointing away” from viewer
- **Back face culling**: do not draw back faces (saves resources)

- How to detect back faces?
Back Face Culling

- Goal: Test if a face \( F \) is backface
- How? Form vectors
  - View vector, \( V \)
  - Normal \( N \) to face \( F \)

Backface test: \( F \) is backface if \( N \cdot V < 0 \) why??
void drawFrontFaces( )
{
    for(int f = 0; f < numFaces; f++)
    {
        if(isBackFace(f, ....) continue;
        glDrawArrays(GL_POLYGON, 0, N);
    }
    if N.V < 0
View-Frustum Culling

- **Goal**: Remove objects outside view frustum
- Done by 3D clipping algorithm (e.g. Liang-Barsky)
Ray Tracing

- **Ray tracing** is another image space method.
- Ray tracing: Cast a ray from eye through each pixel into world.
- Ray tracing algorithm figures out: what object seen in direction through given pixel?
