

**CS 543: Computer Graphics**  
**Lecture 9 (Part II): Raster Graphics Part 2**

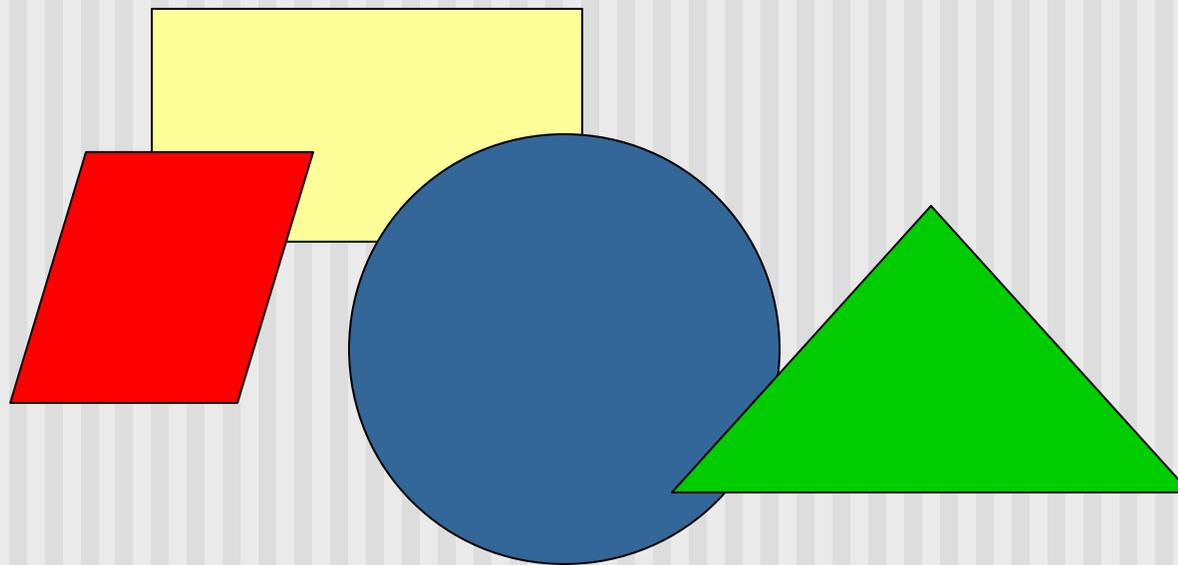

Emmanuel Agu

## So Far...

- Raster graphics:
  - Line drawing algorithms (simple, Bresenham's)
- Today:
  - Defining and filling regions
  - Polygon drawing and filling
  - Antialiasing

## Defining and Filling Regions of Pixels

- First, understand how to define and fill any defined regions
- Next, how to fill regions bounded by a polygon

# Defining and Filling Regions of Pixels

- Methods of defining region
  - Pixel-defined: specifies pixels in color or geometric range
  - Symbolic: provides property pixels in region must have
  - Examples of symbolic:
    - Closeness to some pixel
    - Within circle of radius  $R$
    - Within a specified polygon

## Pixel-Defined Regions

- **Definition:** Region R is the set of all pixels having color C that are connected to a given pixel S
- **4-adjacent:** pixels that lie next to each other horizontally or vertically, NOT diagonally
- **8-adjacent:** pixels that lie next to each other horizontally, vertically OR diagonally
- **4-connected:** if there is unbroken path of 4-adjacent pixels connecting them
- **8-connected:** unbroken path of 8-adjacent pixels connecting them

## Recursive Flood-Fill Algorithm

- Recursive algorithm
- Starts from initial pixel of color, `intColor`
- Recursively set 4-connected neighbors to `newColor`
- **Flood-Fill**: floods region with `newColor`
- **Basic idea**:
  - start at "seed" pixel  $(x, y)$
  - If  $(x, y)$  has color `intColor`, change it to `newColor`
  - Do same recursively for all 4 neighbors

## Recursive Flood-Fill Algorithm

- **Note:** `getPixel(x,y)` used to interrogate pixel color at `(x, y)`

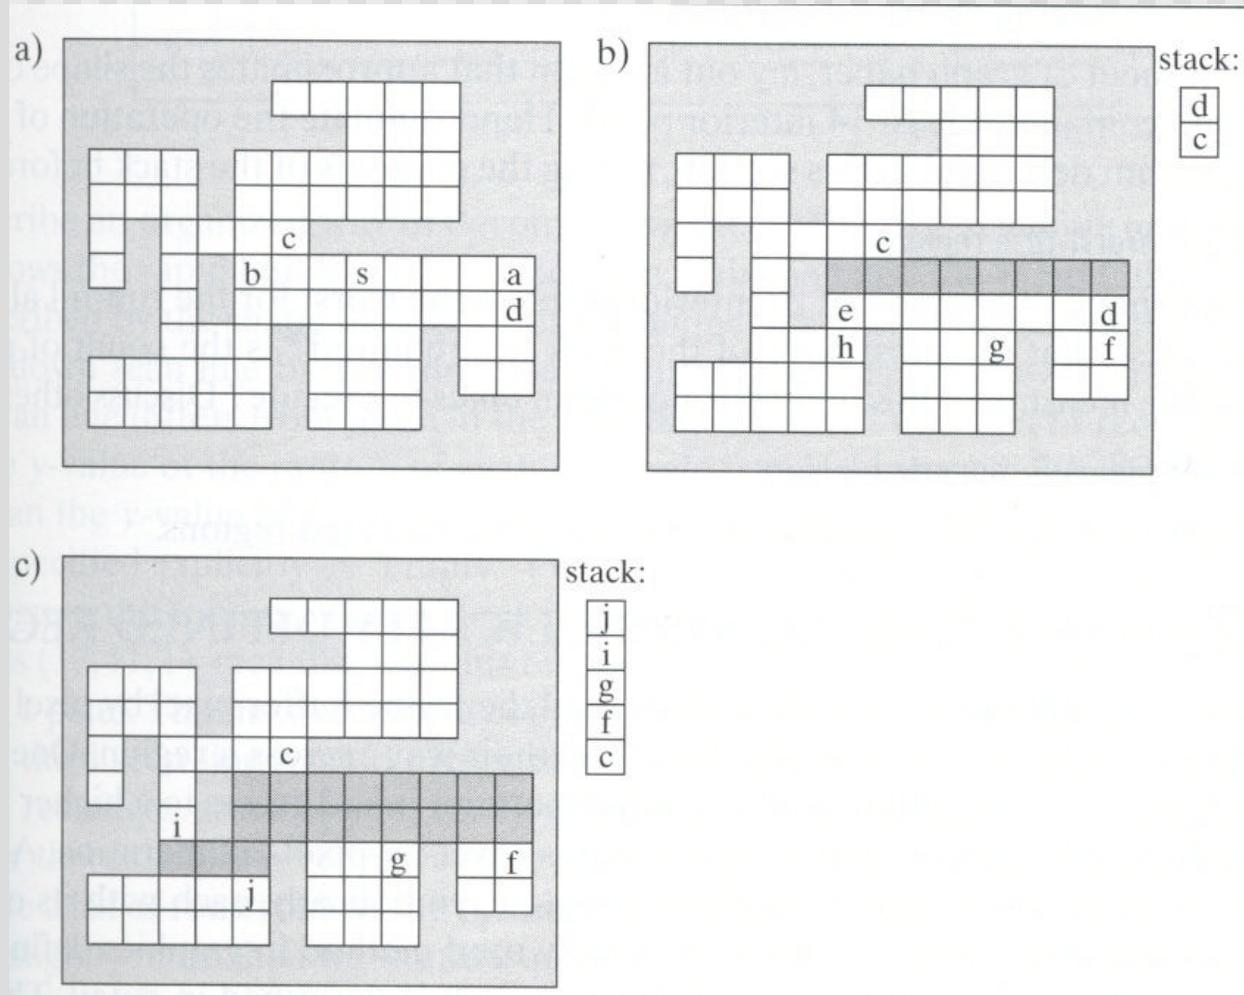

```
void floodFill(short x, short y, short intColor)
{
    if(getPixel(x, y) == intColor)
    {
        setPixel(x, y);
        floodFill(x - 1, y, intColor); // left pixel
        floodFill(x + 1, y, intColor); // right pixel
        floodFill(x, y + 1, intColor); // down pixel
        floodFill(x, y - 1, intColor); // fill up
    }
}
```

## Recursive Flood-Fill Algorithm

- This version defines region using intColor
- Can also have version defining region by boundary
- Recursive flood-fill is somewhat blind and some pixels may be retested several times before algorithm terminates
- Region coherence is likelihood that an interior pixel mostly likely adjacent to another interior pixel
- Coherence can be used to improve algorithm performance
- A run is a group of adjacent pixels lying on same
- Exploit runs(adjacent, on same scan line) of pixels

# Region Filling Using Coherence

- Example: start at s, initial seed

## Region Filling Using Coherence

- Pseudocode:

```
Push address of seed pixel onto stack
```

```
while(stack is not empty)
```

```
{
```

```
    Pop the stack to provide next seed
```

```
    Fill in the run defined by the seed
```

```
    In the row above find the reachable interior runs
```

```
    Push the address of their rightmost pixels
```

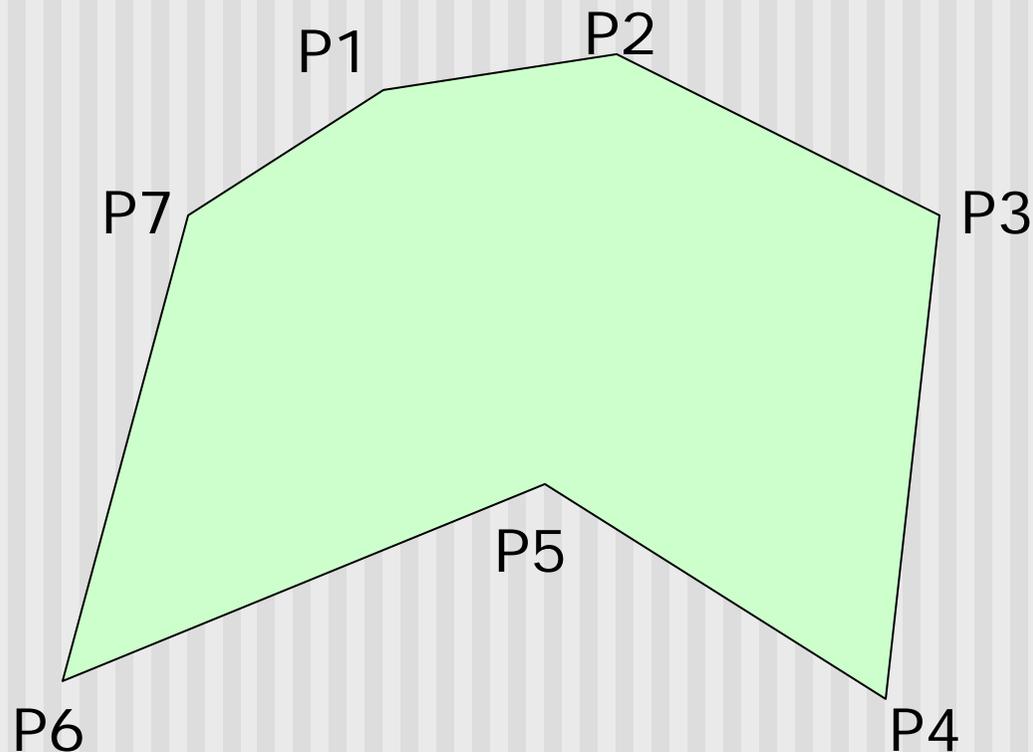

```
    Do the same for row below current run
```

```
}
```

**Note:** algorithm most efficient if there is **span coherence** (pixels on scanline have same value) and **scan-line coherence** (consecutive scanlines are similar)

## Filling Polygon-Defined Regions

- **Problem:** Region defined by Polygon P with vertices  $P_i = (X_i, Y_i)$ , for  $i = 1 \dots N$ , specifying sequence of P's vertices

## Filling Polygon-Defined Regions

- **Solution:** Progress through frame buffer scan line by scan line, filling in appropriate portions of each line
- Filled portions defined by intersection of scan line and polygon edges
- Runs lying between edges inside P are filled

## Filling Polygon-Defined Regions

- Pseudocode:

```
for(each scan Line L)
```

```
{
```

```
    Find intersections of L with all edges of P
```

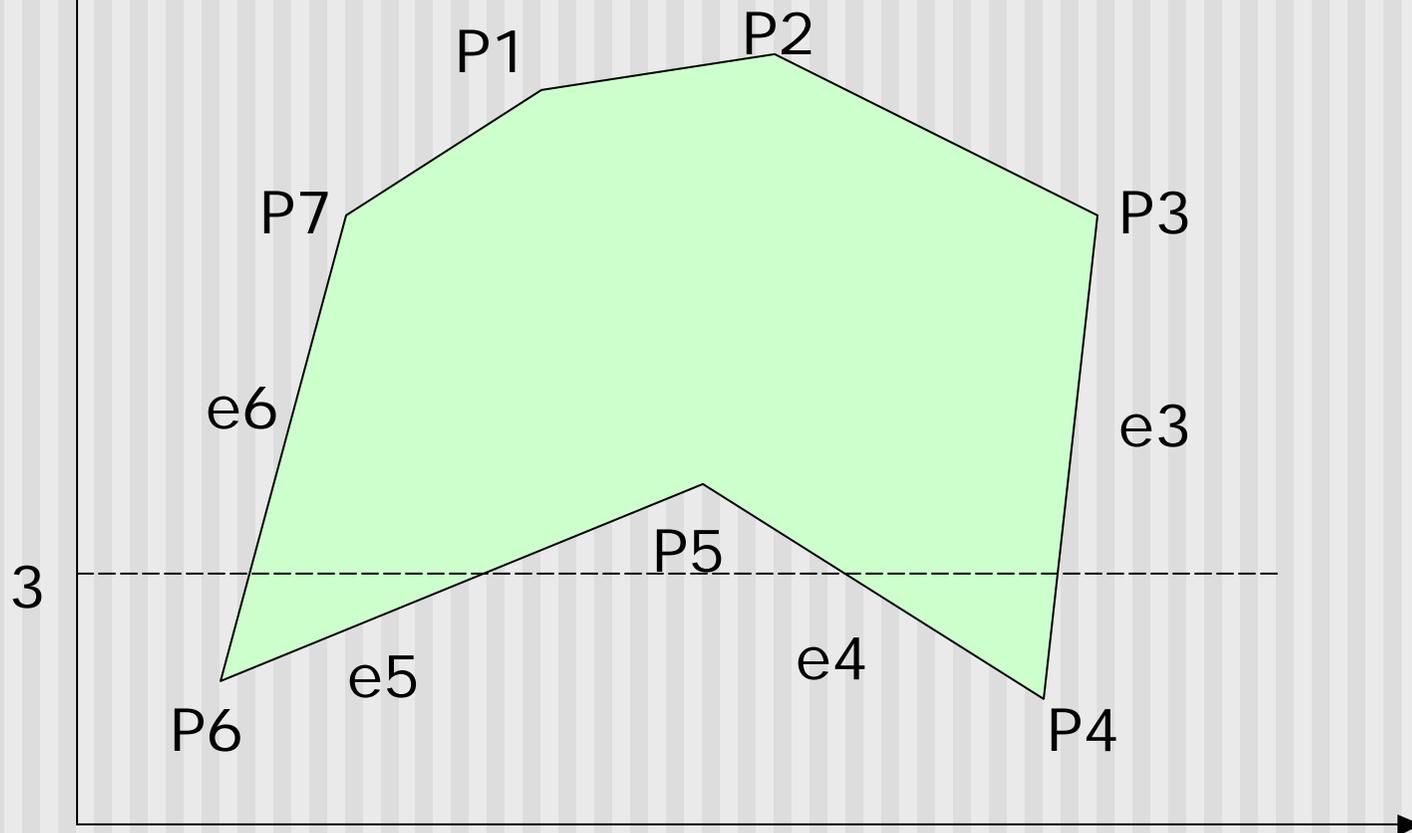

```
    Sort the intersections by increasing x-value
```

```
    Fill pixel runs between all pairs of  
    intersections
```

```
}
```

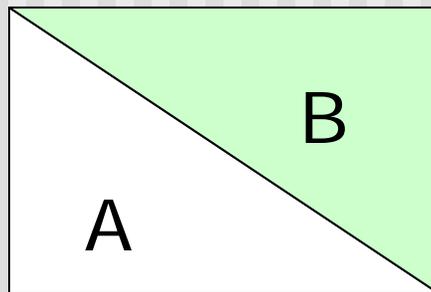

## Filling Polygon-Defined Regions

- **Example:** scan line  $y = 3$  intersects 4 edges  $e3$ ,  $e4$ ,  $e5$ ,  $e6$
- Sort  $x$  values of intersections and fill runs in pairs
- **Note:** at each intersection, inside-outside (parity), or vice versa

## Filling Polygon-Defined Regions

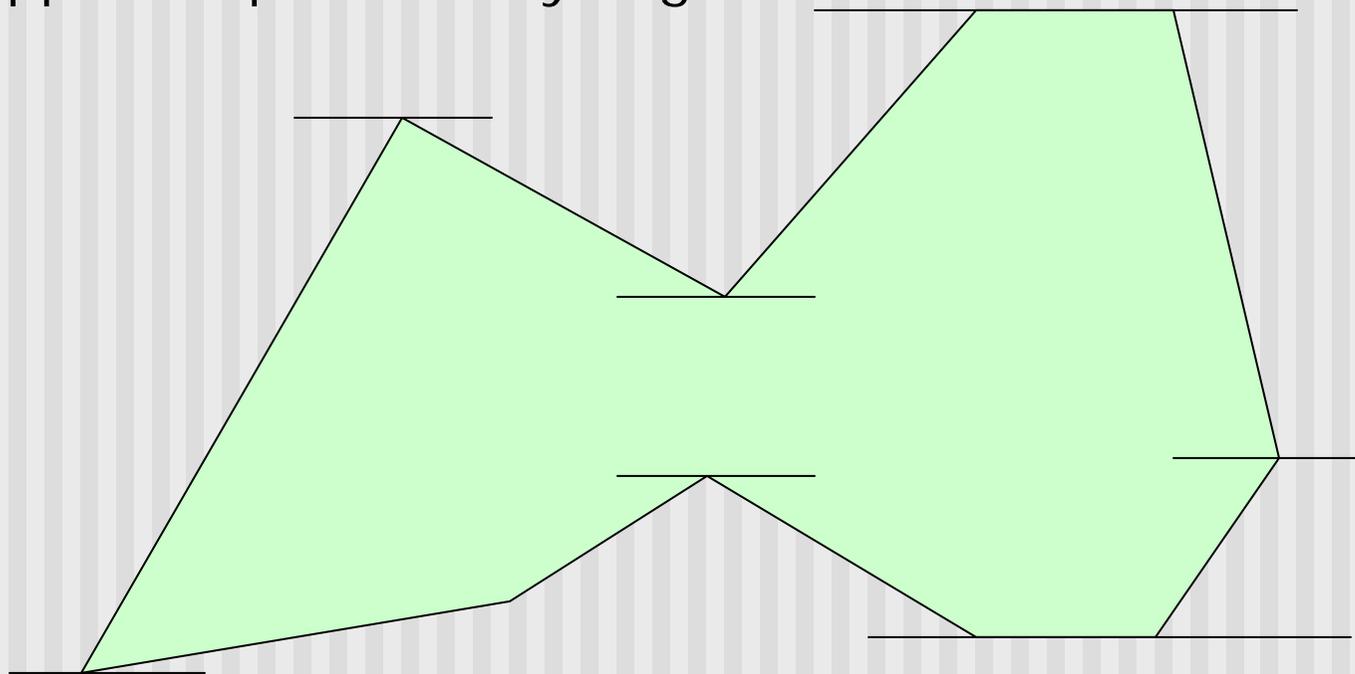

- What if two polygons A, B share an edge?
- Algorithm behavior could result in:
  - setting edge first in one color and the another
  - Drawing edge twice too bright
- **Make Rule:** when two polygons share edge, each polygon owns its left and bottom edges
- E.g. below draw shared edge with color of polygon **B**

**Read:** Hill: 10.7.1, pg 571

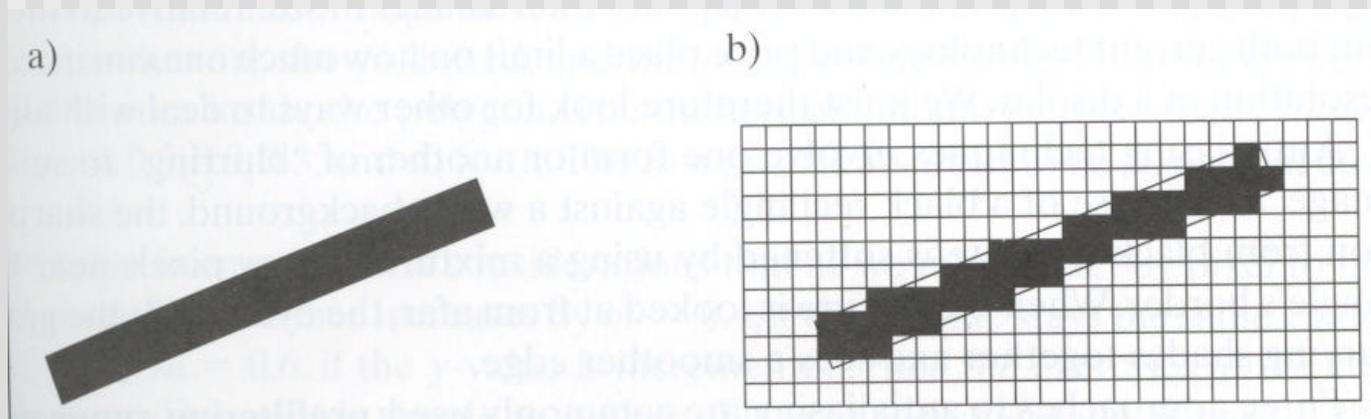

## Filling Polygon-Defined Regions

- How to handle cases where scan line intersects with polygon endpoints?
- Solution: Discard intersections with horizontal edges and with upper endpoint of any edge

# Antialiasing

- Raster displays have pixels as rectangles
- Aliasing: Discrete nature of pixels introduces “jaggies”

# Antialiasing

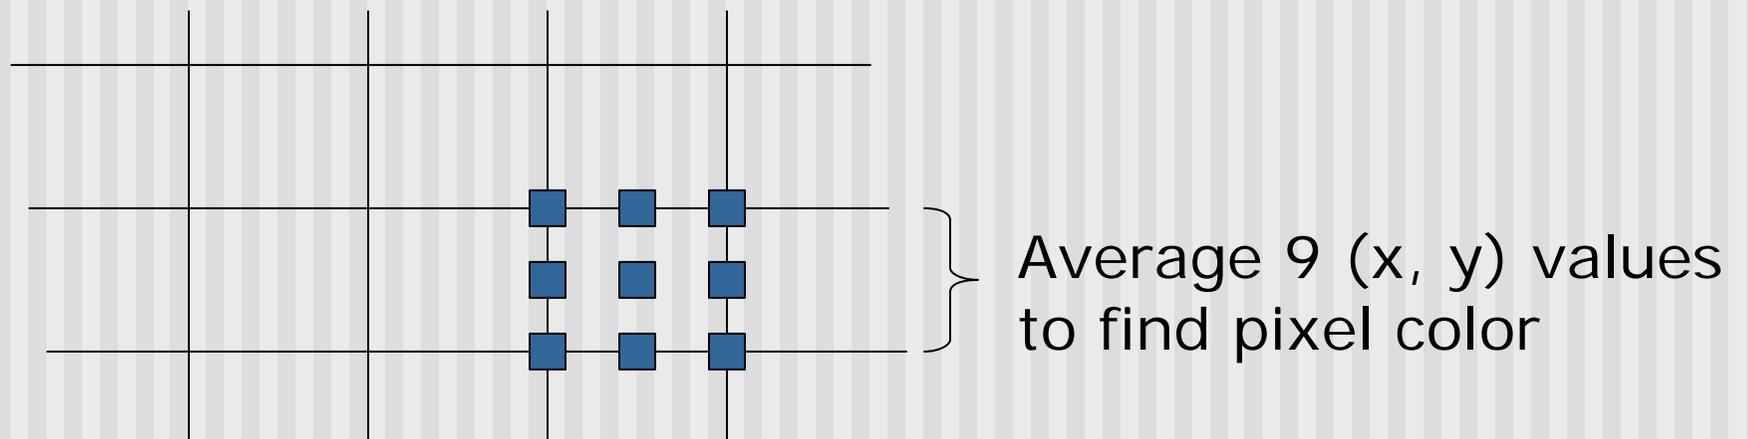

- Aliasing effects:
  - Distant objects may disappear entirely
  - Objects can blink on and off in animations
- Antialiasing techniques involve some form of blurring to reduce contrast, smoothen image
- Three antialiasing techniques:
  - Prefiltering
  - Postfiltering
  - Supersampling

## Prefiltering

- Basic idea:
  - compute area of polygon coverage
  - use proportional intensity value
- Example: if polygon covers  $\frac{1}{4}$  of the pixel
  - use  $\frac{1}{4}$  polygon color
  - add it to  $\frac{3}{4}$  of adjacent region color
- Cons: computing pixel coverage can be time consuming

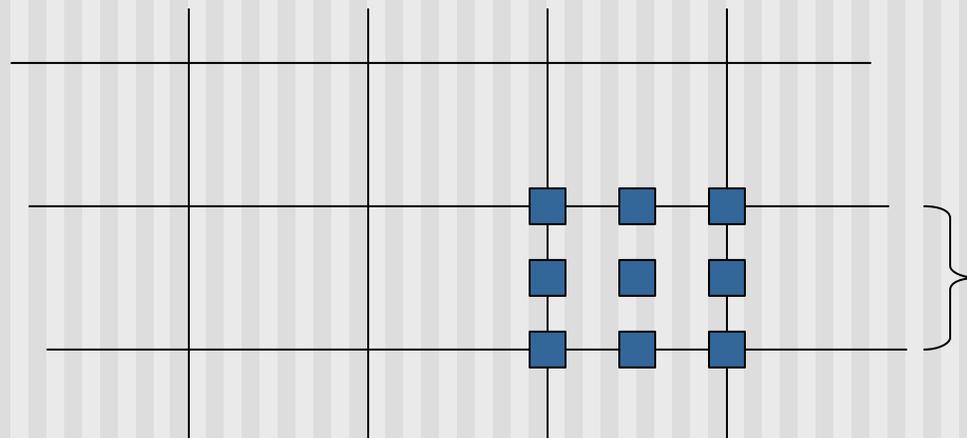

# Supersampling

- Useful if we can compute color of any  $(x,y)$  value on the screen
- Increase frequency of sampling
- Instead of  $(x,y)$  samples in increments of 1
- Sample  $(x,y)$  in fractional (e.g.  $\frac{1}{2}$ ) increments
- Find average of samples
- Example: Double sampling = increments of  $\frac{1}{2}$  = 9 color values averaged for each pixel

# Postfiltering

- Supersampling uses average
- Gives all samples equal importance
- Post-filtering: use weighting (different levels of importance)
- Compute pixel value as weighted average
- Samples close to pixel center given more weight

## Sample weighting

<b>1/16</b>	<b>1/16</b>	<b>1/16</b>
<b>1/16</b>	<b>1/2</b>	<b>1/16</b>
<b>1/16</b>	<b>1/16</b>	<b>1/16</b>

## Antialiasing in OpenGL

- Many alternatives
- Simplest: accumulation buffer
- Accumulation buffer: extra storage, similar to frame buffer
- Samples are accumulated
- When all slightly perturbed samples are done, copy results to frame buffer and draw

# Antialiasing in OpenGL

- First initialize:
  - `glutInitDisplayMode(GLUT_SINGLE | GLUT_RGB | GLUT_ACCUM | GLUT_DEPTH);`
- Zero out accumulation buffer
  - `glClear(GLUT_ACCUM_BUFFER_BIT);`
- Add samples to accumulation buffer using
  - `glAccum( )`

## Antialiasing in OpenGL

- Sample code
- jitter[] stores randomized slight displacements of camera,
- factor, f controls amount of overall sliding

```
glClear(GL_ACCUM_BUFFER_BIT);  
for(int i=0;i < 8; i++)  
{  
    cam.slide(f*jitter[i], f*jitter[i].y, 0);  
    display( );  
    glAccum(GL_ACCUM, 1/8.0);  
}  
glAccum(GL_RETURN, 1.0);
```
