

# Wireless Sensor Networks and the Internet of Things: Do We Need a Complete Integration?

Cristina Alcaraz, Pablo Najera, Javier Lopez, Rodrigo Roman

Presented by Alexander Witt and Aniket Shah

# Overview

- ▶ Introduction
- ▶ Security Integration Challenges
- ▶ Integration Approaches
- ▶ Demystifying the TCP/IP solution issues
- ▶ Case Study
- ▶ Technical Overview
- ▶ Conclusion
- ▶ Critical Review

# Introduction

- ▶ **WSN** - an important element in IoT paradigm; facilitates collaboration of heterogeneous information systems and services
- ▶ Many companies have bought into the above idea, working to find solutions. E.g. : A Smarter Planet by IBM, CeNSE by HP Labs
- ▶ Integration with the Web; **6LoWPAN** uses IPv6 for web services such as SOAP and **REST**
- ▶ Many challenges associated with this sector such as security, physical and virtual connections; especially between WSN and the Internet, etc.

# Security Integration Challenges

- ▶ WSN in IoT raises security challenges; paper focuses on connections at network level
- ▶ **Security** needs to be considered at a global perspective, not just local
  - ▶ Ensures the curbing of additional requirements to integrate local nodes on a global scale
- ▶ Security is an important factor as it helps user perceive **control over information** and not vice versa
- ▶ **Data privacy** is another important feature
  - ▶ Segregation of shared and private data
  - ▶ Confidentiality in business scenarios

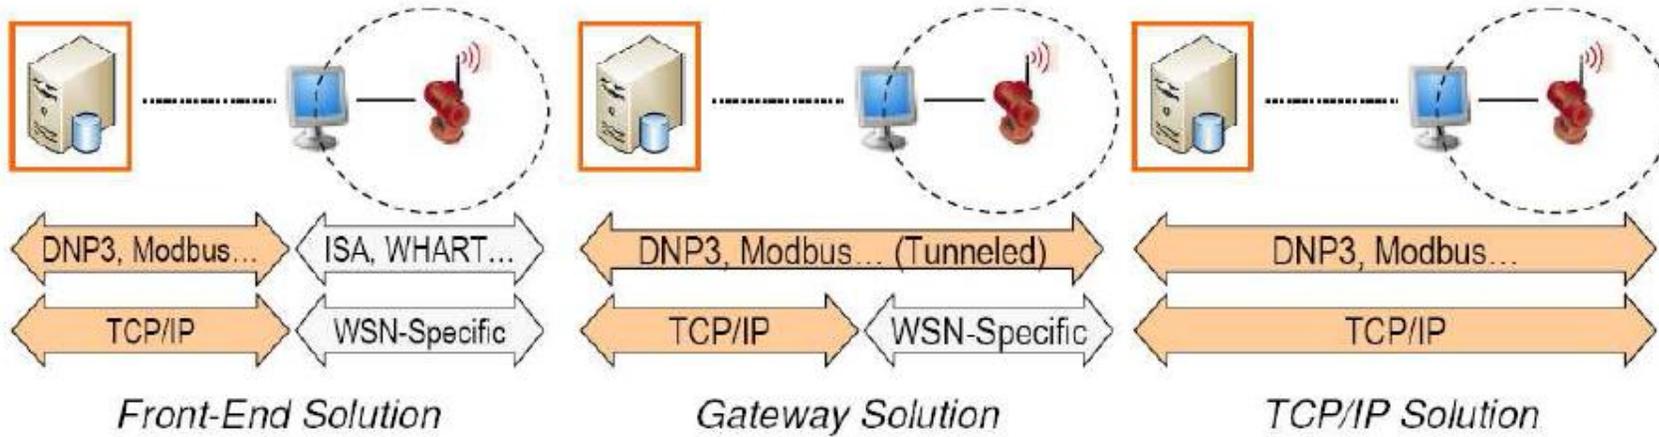

# Security Integration Challenges

- ▶ Another significant aspect under consideration is **Component security**
  - ▶ Security protocols at network level
  - ▶ Interaction between objects and services
- ▶ Objects and infrastructures of an IoT network should be able to handle several identification and security mechanisms in a transparent and scalable way
- ▶ Need to reach equilibrium point in secure interactions is an interesting problem

# Integration Approaches

- ▶ For network design, it is necessary to know the integration approaches to connect to both infrastructures of WSN and the Internet
  - ▶ Classification: Stack based or Topology based
- ▶ **Stack based**: integration level depends on similarities between network stacks of WSN and Internet
  - ▶ Classification: Front End, Gateway or TCP/IP
- ▶ **Topology based**: integration level depends on actual location of nodes
  - ▶ Classification: Hybrid or Access Point

# Integration Approaches

Stack-Based Approaches

[Fig. 1]

Topology-Based Approaches

# Stack-based Classification

- ▶ *Front-end solution*: WSN independent from the Internet
  - ▶ Implements its own protocols
  - ▶ All interaction managed by a centralized base station
- ▶ *Gateway solution*: WSN can exchange information with Internet hosts
  - ▶ Internet hosts and sensor nodes can address each other indirectly through a gateway
  - ▶ Base station acts as application layer gateway; translating lower layer protocols and routing information
- ▶ *TCP/IP solution*: WSN shares a **compatible network layer protocol**
  - ▶ Sensor nodes implement TCP/IP (or 6LoWPAN) to become a part of the Internet
  - ▶ Sensor nodes may not be able to use specific WSN protocols

# Topology-based Classification

- ▶ *Hybrid solution*: Dual sensor nodes located at root of the WSN
  - ▶ A set of nodes located at the edge can access the Internet directly and become base stations
  - ▶ This approach provides **redundancy** and **network intelligence**
- ▶ *Access Point solution*: Backbone of devices that allow sensing nodes to access the Internet in a single hop
  - ▶ WSNs become unbalanced tree with multiple roots (sensor nodes with Internet enabled nodes)
  - ▶ Increases capabilities of nodes in the backbone network
- ▶ In most cases, Topology based networks are combined with Stack based classification except for the TCP/IP solution

# Demystifying the TCP/IP solution issues

- ▶ TCP/IP provides best solution to integrate WSN and the Internet
  - ▶ External system can access node information directly
  - ▶ Nodes can query Internet for services
- ▶ Multiple factors to be considered for complete integration
  - ▶ Existing issues may affect WSN whose nodes are completely integrated into the Internet
  - ▶ More challenging to assure security of WSNs that make use of the TCP/IP solution

# Factors determining integration approach

- ▶ **Resilience**: Security mechanisms to increase robustness against attacks (such as Denial of Service)
- ▶ **User Authentication and Authorization**: Permission storage; consider implementing single sign-on systems
- ▶ **Communication Security**: Analyze other secure communication channels (e.g. TLS); study different key exchange mechanisms
- ▶ **Accountability**: Be able to record interactions with user; will help recreate security incidents and abnormal situations

# Factors determining integration approach

- ▶ *Functionality*: Some nodes need not be aware of the Internet due to limited functions (tasks)
- ▶ *Hardware*: Certain nodes may not connect to the Internet directly due to memory constraints of security mechanisms
- ▶ *Inherent weakness*: Decide whether certain applications should isolate nodes from the Internet; filtering traffic at the network edge
- ▶ *Network redundancy*: Necessary to develop mechanisms in TCP/IP environments to deal with exceptions such as unreachable nodes
- ▶ *Protocol optimization*: Most protocols allow a network to self-heal and optimize internal behavior; yet to be found for 6LoWPAN networks

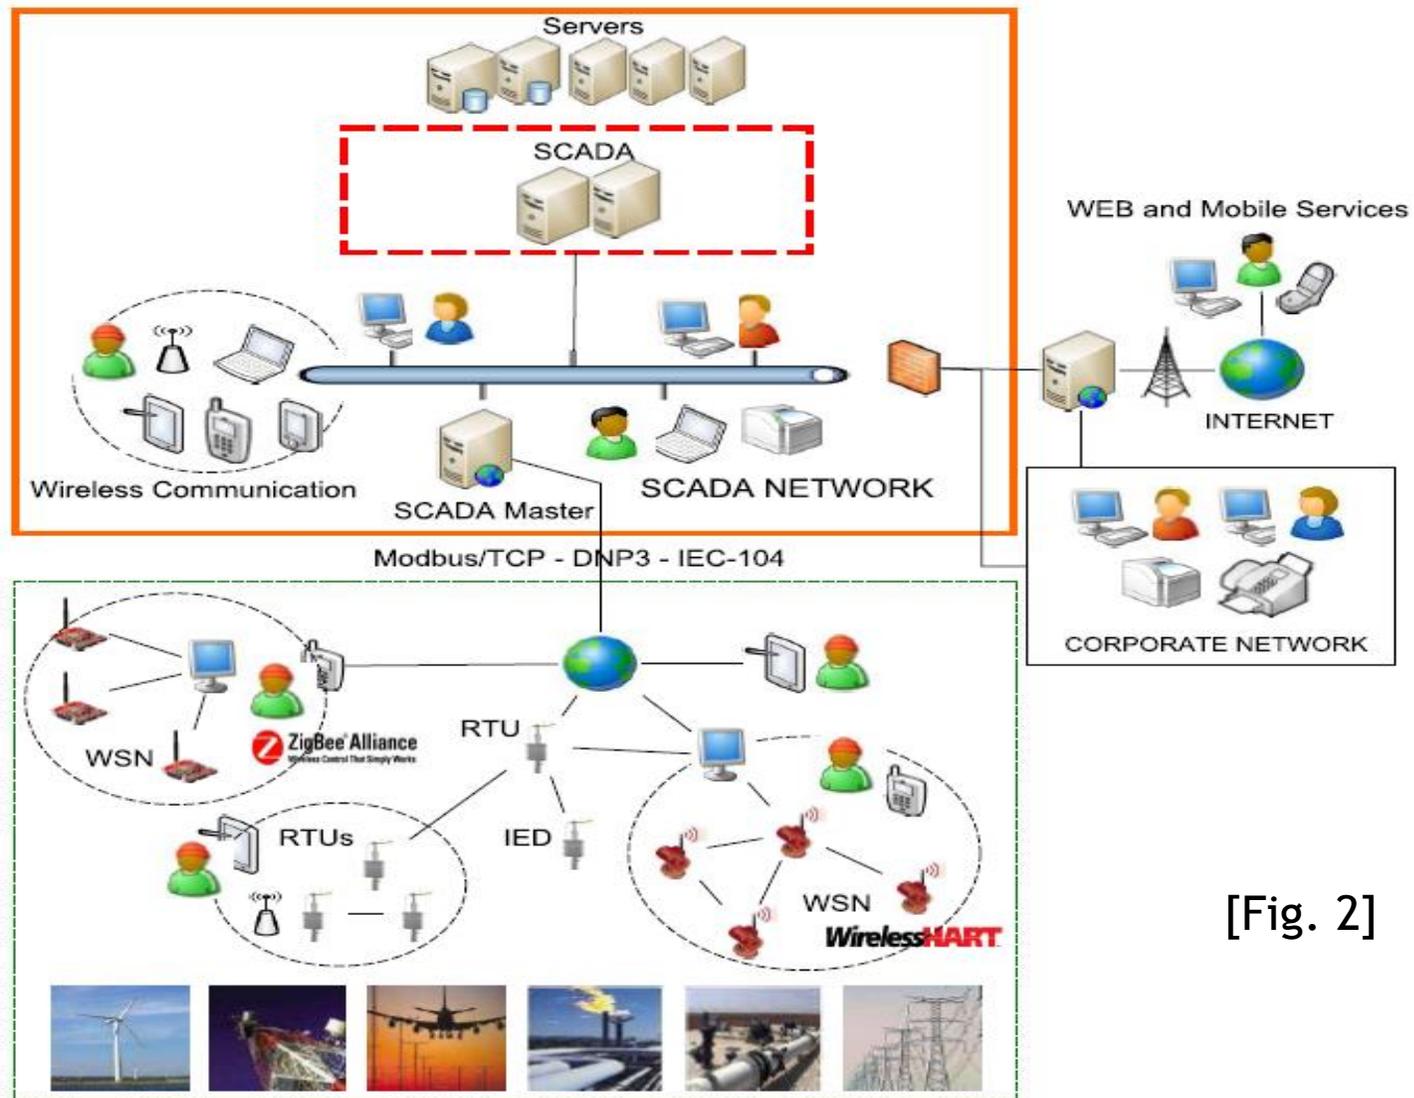

# Case Study - SCADA Systems and First Responders

- ▶ Pure TCP/IP integration solution has certain limitations, especially in terms of security
- ▶ Application **requirements determine the type of integration** solution
- ▶ Two sensor network applications analyzed:
  - ▶ WSN enabled SCADA system
  - ▶ First Responder system

# SCADA Systems

- ▶ SCADA - Supervisory Control and Data Acquisition system
- ▶ Uses new technology to monitor many critical infrastructures in real time
- ▶ Main elements of a SCADA system:
  - ▶ Central control systems - remote monitoring of infrastructures by humans
  - ▶ Remote subsystems - located within the infrastructure; provides data/ information from various elements of the infrastructures

# SCADA Network Architecture

[Fig. 2]

# SCADA Systems

- ▶ Migration to IP for automation has increased with TCP/IP real time monitoring and communication
- ▶ Led to **development of hybrid technologies** (e.g. Bluetooth, Wi-Fi, Zig-Bee, WSNs, etc.)
- ▶ WSNs considered as key technology
  - ▶ Smart and autonomous
  - ▶ Auto-configuration
  - ▶ Self monitoring and self-healing
  - ▶ Anomaly detection and tracking

# SCADA Systems

- ▶ Industrial applications have led to various products
  - ▶ MeshNetics nodes (Zig-Bee) launched SensiLink Integration platform
  - ▶ Cooper Power Systems' wireless Outage advisor for Electric power systems
  - ▶ Sensus' FlexNet SmartPoints for power systems
- ▶ **Interoperability** of products is based on industrial standards such as ZigBee, WirelessHART and ISA100.11a (based on the IEEE 802.15.4-2006 standard) which specifies the PHY and MAC layers of WPANs
- ▶ Main goal of these standards
  - ▶ secure connectivity
  - ▶ energy saving using a wireless mesh network
  - ▶ interoperability with other systems
  - ▶ data reliability

# First Responder Systems

- ▶ Sensor networks play disaster response roles such as monitoring, tracking, triage etc. Hence the name first responder systems
- ▶ Creates and **maintains information structure** when other communication and support system not available
  - ▶ Reason: Dynamic and autonomous nature of WSN
- ▶ Many advantages of WSN-base first responder system integration with the Internet
  - ▶ Network at disaster location helps visualize distant events
  - ▶ Global view of disaster situation
  - ▶ Interaction with centralized situation to optimize task distribution

# Analysis

## INTEGRATION SOLUTIONS AND APPLICATIONS

	Overview	SCADA	FIRST RESPONDERS
<b>TCP/IP</b>	<ul style="list-style-type: none"> <li>→ Distributed mechanisms</li> <li>× Device overhead</li> <li>× Weak to external attackers</li> <li>✓ Resilient to device failure</li> <li>✓ Direct access to the devices</li> </ul>	<ul style="list-style-type: none"> <li>→ Long lifetime: must support multiple protocols</li> <li>→ <span style="border: 1px solid red; padding: 2px;">Devices do not need to be Internet-aware</span></li> <li>× Critical Environment</li> <li>× SCADA-specific protocols provide extra properties</li> </ul>	<ul style="list-style-type: none"> <li>✓ Short lifetime: deployment-specific protocols</li> <li>✓ Devices can take advantage of Internet-awareness</li> </ul>
<b>FRONT-END</b>	<ul style="list-style-type: none"> <li>→ Centralized management</li> <li>× Single point of failure</li> <li>✓ Store and Forward, Redundancy</li> </ul>	<ul style="list-style-type: none"> <li>→ Increase access points to improve robustness</li> <li>✓ Isolation of the sensor devices</li> </ul>	<ul style="list-style-type: none"> <li>→ No need for redundancy</li> <li>→ Extra access points might not be available</li> <li>× Node Isolation might be counterproductive</li> </ul>
<b>GATEWAY</b>	<ul style="list-style-type: none"> <li>→ Mixed Architecture</li> <li>× Single point of failure</li> <li>✓ Application-Layer access</li> </ul>	<ul style="list-style-type: none"> <li>→ Increase access points to improve robustness</li> <li>→ Some intelligence should be pushed to the devices</li> </ul>	<ul style="list-style-type: none"> <li>→ Extra access points might not be available</li> </ul>

# Analysis

- ▶ For SCADA systems, benefits of pure TCP/IP solution don't warrant complete integration of WSN with the Internet
- ▶ Increase in network traffic can become problematic for WSN nodes due to their limited capabilities
- ▶ Existence of a central entry point makes the Gateway solution vulnerable against availability attacks. This can be solved by using the Hybrid and Access Point solutions
- ▶ TCP/IP solution for First responders works well as there is **limited overhead** on nodes
- ▶ Benefits associated with Front-end and Gateway solutions for First responder systems are not so important in these emergency scenarios

# Technical Overview

- ▶ Different technologies used to protect a WSN
  - ▶ **Cryptographic primitives** (ECRYPT Stream Ciphers, PKC ECC, Rabbit)
  - ▶ Attestation and detection systems
  - ▶ Key management systems
- ▶ Security technologies being developed
  - ▶ Secure routing
  - ▶ Time synchronization
  - ▶ Trust management
  - ▶ Secure middleware
- ▶ Essential for protection to nodes (in nodes or inside routers / base stations)

# Conclusion

- ▶ Full integration at the network level may not be necessary
- ▶ Some applications should not connect their nodes directly to the Internet
- ▶ There are more security issues when integrating WSN with the IoT:
  - ▶ Integration of security mechanisms & services
  - ▶ User acceptance
  - ▶ Management of data privacy

# Critical Review

- ▶ Good indication of tradeoffs existing in different approaches to integration
- ▶ Do not impose a doctrine for good IoT security but discuss security attributes
- ▶ Discuss attributes of the environment that may influence scheme selection
- ▶ The paper is organized well but could explain certain sections better
- ▶ Discuss TCP/IP connectivity to the Internet
  - ▶ Do not mention if battery life is a constraint to consider (are WSNs wired or not)
- ▶ Good bearing on the value of cryptographic primitives in IoT
  - ▶ Lightweight Simon & Speck block cipher undergoing standardization

Thank You
