

# *Classes: A Deeper Look*

**Systems Programming**

# Deeper into C++ Classes

- **const** objects and **const** member functions
- Composition
- Friendship
- **this** pointer
- Dynamic memory management
  - **new** and **delete** operators
- **static** class members and member functions
- Abstract Data Types

# 21.2 const (Constant) Objects and const Member Functions

- Principle of least privilege
  - One of the most fundamental principles of good software engineering
  - Applies to objects, too
- **const** objects
  - Keyword **const**
  - Specifies that an object is not modifiable.
  - Attempts to modify the object will result in compilation errors.

## Example

- **Const Time noon (12, 0, 0);**

© 2007 Pearson Ed -All rights reserved.

# const (Constant) Objects and const Member Functions

- const member functions
  - Only **const** member function can be called for **const** objects.
  - Member functions declared **const** are not allowed to modify the object.
  - A function is specified as **const** both in its prototype and in its definition.
  - **const** declarations are not allowed for constructors and destructors.

© 2007 Pearson Ed -All rights reserved.

# Software Engineering Observation 21.2

- A **const** member function can be overloaded with a non-**const** version. The compiler chooses which overloaded member function to use based on the object on which the function is invoked. If the object is **const**, the compiler uses the **const** version. If the object is not **const**, the compiler uses the non-**const** version.

# const Example

```
1 // Fig. 21.1: Time.h
2 // Definition of class Time.
3 // Member functions defined in Time.cpp.
4 #ifndef TIME_H
5 #define TIME_H
6
7 class Time
8 {
9 public:
10     Time( int = 0, int = 0, int = 0 ); // default constructor
11
12     // set functions
13     void setTime( int, int, int ); // set time
14     void setHour( int ); // set hour
15     void setMinute( int ); // set minute
16     void setSecond( int ); // set second
17
18     // get functions (normally declared const)
19     int getHour() const; // return hour
20     int getMinute() const; // return minute
21     int getSecond() const; // return second
```

© 2007 Pearson Ed -All rights reserved.

# const Example

```
22
23 // print functions (normally declared const)
24 void printUniversal() const; // print universal time
25 void printStandard(); // print standard time (should be const)
26 private:
27 int hour; // 0 - 23 (24-hour clock format)
28 int minute; // 0 - 59
29 int second; // 0 - 59
30 }; // end class Time
31
32 #endif
```

© 2007 Pearson Ed -All rights reserved.

# const Example

```
1 // Fig. 21.2: Time.cpp
2 // Member-function definitions for class Time.
3 #include <iostream>
4 using std::cout;
5
6 #include <iomanip>
7 using std::setfill;
8 using std::setw;
9
10 #include "Time.h" // Include definition of class Time
11
12 // constructor function to initialize private data;
13 // calls member function setTime to set variables;
14 // default values are 0 (see class definition)
15 Time::Time( int hour, int minute, int second )
16 {
17     setTime( hour, minute, second );
18 } // end Time constructor
19
20 // set hour, minute and second values
21 void Time::setTime( int hour, int minute, int second )
22 {
23     setHour( hour );
24     setMinute( minute );
25     setSecond( second );
26 } // end function setTime
```

© 2007 Pearson Ed -All rights reserved.

# const Example

```
27
28 // set hour value
29 void Time::setHour( int h )
30 {
31     hour = ( h >= 0 && h < 24 ) ? h : 0; // validate hour
32 } // end function setHour
33
34 // set minute value
35 void Time::setMinute( int m )
36 {
37     minute = ( m >= 0 && m < 60 ) ? m : 0; // validate minute
38 } // end function setMinute
39
40 // set second value
41 void Time::setSecond( int s )
42 {
43     second = ( s >= 0 && s < 60 ) ? s : 0; // validate second
44 } // end function setSecond
45
46 // return hour value
47 int Time::getHour() const // get functions should be const
48 {
49     return hour;
50 } // end function getHour
```

const keyword in function definition,  
as well as in function prototype

© 2007 Pearson Ed -All rights reserved.

# const Example

```
51
52 // return minute value
53 int Time::getMinute() const
54 {
55     return minute;
56 } // end function getMinute
57
58 // return second value
59 int Time::getSecond() const
60 {
61     return second;
62 } // end function getSecond
63
64 // print Time in universal-time format (HH:MM:SS)
65 void Time::printUniversal() const
66 {
67     cout << setfill( '0' ) << setw( 2 ) << hour << ":"
68         << setw( 2 ) << minute << ":" << setw( 2 ) << second;
69 } // end function printUniversal
70
71 // print Time in standard-time format (HH:MM:SS AM or PM)
72 void Time::printStandard() // note lack of const declaration
73 {
74     cout << ( ( hour == 0 || hour == 12 ) ? 12 : hour % 12 )
75         << ":" << setfill( '0' ) << setw( 2 ) << minute
76         << ":" << setw( 2 ) << second << ( hour < 12 ? " AM" : " PM" );
77 } // end function printStandard
```

© 2007 Pearson Ed -All rights reserved.

# const Example

```
1 // Fig. 21.3: fig21_03.cpp
2 // Attempting to access a const object with non-const member functions.
3 #include "Time.h" // include Time class definition
4
5 int main()
6 {
7     Time wakeUp( 6, 45, 0 ); // non-constant object
8     const Time noon( 12, 0, 0 ); // constant object
9
10         // OBJECT      MEMBER FUNCTION
11     wakeUp.setHour( 18 ); // non-const non-const
12
13     noon.setHour( 12 ); // const non-const
14
15     wakeUp.getHour(); // non-const const
16
17     noon.getMMinute(); // const const
18     noon.printUniversal(); // const const
19
20     noon.printStandard(); // const non-const
21     return 0;
22 } // end main
```

Cannot invoke non-**const** member functions on a **const** object

# Member\_INITIALIZER

- Required for initializing
  - **const** data members
  - Data members that are references.
- Can be used for any data member.
- Member initializer list
  - Appears between a constructor's parameter list and the left brace that begins the constructor's body.
  - Separated from the parameter list with a colon (:).
  - Each member initializer consists of the data member name followed by parentheses containing the member's initial value.
  - Multiple member initializers are separated by commas.
  - Executes before the body of the constructor executes.

© 2007 Pearson Ed -All rights reserved.

# Member Initializer

```
1 // Fig. 21.4: Increment.h
2 // Definition of class Increment.
3 #ifndef INCREMENT_H
4 #define INCREMENT_H
5
6 class Increment
7 {
8 public:
9     Increment( int c = 0, int i = 1 ); // default constructor
10
11     // function addIncrement definition
12     void addIncrement()
13     {
14         count += increment;
15     } // end function addIncrement
16
17     void print() const; // prints count and increment
18 private:
19     int count;
20     const int increment; // const data member
21 }; // end class Increment
22
23 #endif
```

**const** data member that must be initialized using a member initializer

© 2007 Pearson Ed -All rights reserved.

# Member Initializer

```
1 // Fig. 21.5: Increment.cpp
2 // Member-function definitions for class Increment demonstrate using a
3 // member initializer to initialize a constant of a built-in data type.
4 #include <iostream>
5 using std::cout;
6 using std::endl;
7
8 #include "Increment.h" // Increment class definition
9
10 // constructor
11 Increment::Increment( int c, int i )
12     : count( c ), // initializer for non-const member
13       increment( i ) // required initializer for const member
14 {
15     // empty body
16 } // end constructor Increment
17
18 // print count and increment values
19 void Increment::print() const
20 {
21     cout << "count = " << count << ", increment = " << increment << endl;
22 } // end function print
```

Colon (:) marks the start of a member initializer list

Member initializer for non-**const** member **count**

Required member initializer for **const** member **increment**

# Member\_INITIALIZER

```
1 // Fig. 21.6: flg21_06.cpp
2 // Program to test class Increment.
3 #include <iostream>
4 using std::cout;
5
6 #include "Increment.h" // include definition of class Increment
7
8 int main()
9 {
10     Increment value( 10, 5 );
11
12     cout << "Before incrementing: ";
13     value.print();
14
15     for ( int j = 1; j <= 3; j++ )
16     {
17         value.increment();
18         cout << "After increment " << j << ": ";
19         value.print();
20     } // end for
21
22     return 0;
23 } // end main
```

Before incrementing: count = 10, increment = 5  
After increment 1: count = 15, increment = 5  
After increment 2: count = 20, increment = 5  
After increment 3: count = 25, increment = 5

# Software Engineering Observation 21.3

- A **const** object cannot be modified by assignment, so it must be initialized. When a data member of a class is declared **const**, a member initializer must be used to provide the constructor with the initial value of the data member for an object of the class. The same is true for references.

© 2007 Pearson Ed -All rights reserved.

# Common Programming Error 21.5

- Not providing a member initializer for a **const** data member is a compilation error.

© 2007 Pearson Ed -All rights reserved.

# Software Engineering Observation 21.4

- Constant data members (**const** objects and **const** variables) and data members declared as **references** must be initialized with member initializer syntax; assignments for these types of data in the constructor body are not allowed.

© 2007 Pearson Ed -All rights reserved.

# 21.3 Composition: Objects as Members of Classes

## • Composition

- Sometimes referred to as a *has-a relationship*.
- A class can have objects of other classes as members.
- Example
  - **AI armClock** object with a **Time** object as a member

# Composition: Objects as Members of Classes

- Initializing member objects
  - Member initializers pass arguments from the object's constructor to member-object constructors.
  - Member objects are constructed in the order in which they are declared in the class definition.
    - Not in the order they are listed in the constructor's member initializer list.
    - Before the enclosing class object (host object) is constructed.
  - If a member initializer is not provided
    - The member object's default constructor will be called implicitly.

© 2007 Pearson Ed -All rights reserved.

# Software Engineering Observation 21.5

- A common form of software reusability is composition, in which a class has objects of other classes as members.

© 2007 Pearson Ed -All rights reserved.

# Composition Example

```
1 // Fig. 21.10: Date.h
2 // Date class definition; Member functions defined in Date.cpp
3 #ifndef DATE_H
4 #define DATE_H
5
6 class Date
7 {
8 public:
9     Date( int = 1, int = 1, int = 1900 ); // default constructor
10    void print() const; // print date in month/day/year format
11    ~Date(); // provided to confirm destruction order
12 private:
13    int month; // 1-12 (January-December)
14    int day; // 1-31 based on month
15    int year; // any year
16
17    // utility function to check if day is proper for month and year
18    int checkDay( int ) const;
19 }; // end class Date
20
21 #endif
```

© 2007 Pearson Ed -All rights reserved.

# Composition Example

```
1 // Fig. 21.11: Date.cpp
2 // Member-function definitions for class Date.
3 #include <iostream>
4 using std::cout;
5 using std::endl;
6
7 #include "Date.h" // include Date class definition
8
9 // constructor confirms proper value for month; calls
10 // utility function checkDay to confirm proper value for day
11 Date::Date( int mn, int dy, int yr )
12 {
13     if ( mn > 0 && mn <= 12 ) // validate the month
14         month = mn;
15     else
16     {
17         month = 1; // invalid month set to 1
18         cout << "Invalid month (" << mn << ") set to 1.\n";
19     } // end else
20
21     year = yr; // could validate yr
22     day = checkDay( dy ); // validate the day
23
24     // output Date object to show when its constructor is called
25     cout << "Date object constructor for date ";
26     print();
27     cout << endl;
28 } // end Date constructor
```

© 2007 Pearson Ed -All rights reserved.

# Composition Example

```
29
30 // print Date object in form month/day/year
31 void Date::print() const
32 {
33     cout << month << '/' << day << '/' << year;
34 } // end function print
35
36 // output Date object to show when its destructor is called
37 Date::~Date()
38 {
39     cout << "Date object destructor for date ";
40     print();
41     cout << endl;
42 } // end ~Date destructor
```

© 2007 Pearson Ed -All rights reserved.

# Composition Example

```
43
44 // utility function to confirm proper day value based on
45 // month and year; handles leap years, too
46 int Date::checkDay( int testDay ) const
47 {
48     static const int daysPerMonth[ 13 ] =
49         { 0, 31, 28, 31, 30, 31, 30, 31, 31, 30, 31, 30, 31 };
50
51     // determine whether testDay is valid for specified month
52     if ( testDay > 0 && testDay <= daysPerMonth[ month ] )
53         return testDay;
54
55     // February 29 check for leap year
56     if ( month == 2 && testDay == 29 && ( year % 400 == 0 ||
57         ( year % 4 == 0 && year % 100 != 0 ) ) )
58         return testDay;
59
60     cout << "Invalid day (" << testDay << ") set to 1.\n";
61     return 1; // leave object in consistent state if bad value
62 } // end function checkDay
```

© 2007 Pearson Ed -All rights reserved.

# Composition Example

```
1 // Fig. 21.12: Employee.h
2 // Employee class definition.
3 // Member functions defined in Employee.cpp.
4 #ifndef EMPLOYEE_H
5 #define EMPLOYEE_H
6
7 #include "Date.h" // include Date class definition
8
9 class Employee
10 {
11 public:
12     Employee( const char * const, const char * const,
13             const Date &, const Date & );
14     void print() const;
15     ~Employee(); // provided to confirm deletion
16 private:
17     char firstName[ 25 ];
18     char lastName[ 25 ];
19     const Date birthDate; // composition: member object
20     const Date hireDate; // composition: member object
21 }; // end class Employee
22
23 #endif
```

Parameters to be passed via member initializers to the constructor for class **Date**

**const** objects of class **Date** as members

© 2007 Pearson Ed -All rights reserved.

# Composition Example

```
1 // Fig. 21.13: Employee.cpp
2 // Member-function definitions for class Employee.
3 #include <iostream>
4 using std::cout;
5 using std::endl;
6
7 #include <cstring> // strlen and strcpy prototypes
8 using std::strlen;
9 using std::strcpy;
10
11 #include "Employee.h" // Employee class definition
12 #include "Date.h" // Date class definition
13
14 // constructor uses member initializer list to pass initializer
15 // values to constructors of member objects birthDate and hireDate
16 // [Note: This invokes the so-called "default copy constructor" which the
17 // C++ compiler provides implicitly.]
18 Employee::Employee( const char * const first, const char * const last,
19     const Date &dateOfBirth, const Date &dateOfHire )
20     : birthDate( dateOfBirth ), // initialize birthDate
21       hireDate( dateOfHire ) // initialize hireDate
22 {
23     // copy first into firstName and be sure that it fits
24     int length = strlen( first );
25     length = ( length < 25 ? length : 24 );
26     strcpy( firstName, first, length );
27     firstName[ length ] = '\0';
```

Member initializers that pass arguments to **Date**'s implicit default copy constructor

© 2007 Pearson Ed -All rights reserved.

# Composition Example

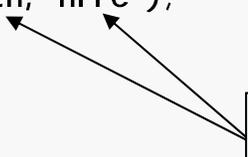

```
28
29 // copy last into lastName and be sure that it fits
30 length = strlen( last );
31 length = ( length < 25 ? length : 24 );
32 strncpy( lastName, last, length );
33 lastName[ length ] = '\\0';
34
35 // output Employee object to show when constructor is called
36 cout << "Employee object constructor: "
37     << firstName << " " << lastName << endl;
38 } // end Employee constructor
39
40 // print Employee object
41 void Employee::print() const
42 {
43     cout << lastName << ", " << firstName << " Hired: ";
44     hireDate.print();
45     cout << " Birthday: ";
46     birthDate.print();
47     cout << endl;
48 } // end function print
49
50 // output Employee object to show when its destructor is called
51 Employee::~Employee()
52 {
53     cout << "Employee object destructor: "
54         << lastName << ", " << firstName << endl;
55 } // end ~Employee destructor
```

© 2007 Pearson Ed -All rights reserved.

# Composition Example

```
1 // Fig. 21.14: fig21_14.cpp
2 // Demonstrating composition--an object with member objects.
3 #include <iostream>
4 using std::cout;
5 using std::endl;
6
7 #include "Employee.h" // Employee class definition
8
9 int main()
10 {
11     Date birth( 7, 24, 1949 );
12     Date hire( 3, 12, 1988 );
13     Employee manager( "Bob", "Blue", birth, hire );
14
15     cout << endl;
16     manager.print();
17
18     cout << "\nTest Date constructor with invalid values:\n";
19     Date lastDayOff( 14, 35, 1994 ); // invalid month and day
20     cout << endl;
21     return 0;
22 } // end main
```

Passing objects to a host object constructor

© 2007 Pearson Ed -All rights reserved.

# Composition Example

```
Date object constructor for date 7/24/1949  
Date object constructor for date 3/12/1988  
Employee object constructor: Bob Blue
```

```
Blue, Bob Hired: 3/12/1988 Birthday: 7/24/1949
```

```
Test Date constructor with invalid values:  
Invalid month (14) set to 1.  
Invalid day (35) set to 1.  
Date object constructor for date 1/1/1994
```

```
Date object destructor for date 1/1/1994  
Employee object destructor: Blue, Bob  
Date object destructor for date 3/12/1988  
Date object destructor for date 7/24/1949  
Date object destructor for date 3/12/1988  
Date object destructor for date 7/24/1949
```

# Common Programming Error 21.6

- A compilation error occurs if a member object is not initialized with a member initializer and the member object's class does not provide a default constructor (i.e., the member object's class defines one or more constructors, but none is a default constructor).

© 2007 Pearson Ed -All rights reserved.

# 21.4 friend Functions and friend Classes

- **friend** function of a class
  - Defined outside that class's scope.
  - Not a member function of that class.
  - has the right to access the non-**public** and **public** members of that class.
  - Standalone functions or entire classes may be declared to be friends of a class.
  - Can enhance performance.
  - Often appropriate when a member function cannot be used for certain operations.

© 2007 Pearson Ed -All rights reserved.

# friend Functions and friend Classes

- To declare a function as a **friend** of a class:
  - Provide the function prototype in the class definition preceded by keyword **friend**.
- To declare a class as a friend of another class:
  - Place a declaration of the form  
**friend class ClassTwo;**  
in the definition of class **ClassOne**
- All member functions of class **ClassTwo** are friends of class **ClassOne**.

# friend Functions and friend Classes

- Friendship is granted, not taken.
  - For class B to be a friend of class A, **class A must explicitly declare that class B is its friend.**
- Friendship relation is neither symmetric nor transitive
  - If class A is a friend of class B, and class B is a friend of class C, you cannot infer that class B is a friend of class A, that class C is a friend of class B, or that class A is a friend of class C.

© 2007 Pearson Ed -All rights reserved.

# friend Functions and friend Classes

- It is possible to specify overloaded functions as friends of a class.
  - Each overloaded function intended to be a friend must be **explicitly declared** as a friend of the class.

© 2007 Pearson Ed -All rights reserved.

# friend Function Example

```
1 // Fig. 21.15: fig21_15.cpp
2 // Friends can access private members of a class.
3 #include <iostream>
4 using std::cout;
5 using std::endl;
6
7 // Count class definition
8 class Count
9 {
10     friend void setX( Count &, int ); // friend declaration
11 public:
12     // constructor
13     Count()
14         : x( 0 ) // initialize x to 0
15     {
16         // empty body
17     } // end constructor Count
18
19     // output x
20     void print() const
21     {
22         cout << x << endl;
23     } // end function print
24 private:
25     int x; // data member
26 }; // end class Count
```

friend function declaration (can appear anywhere in the class)

© 2007 Pearson Ed -All rights reserved.

# friend Function Example

```
27
28 // function setX can modify private data of Count
29 // because setX is declared as a friend of Count (line 10)
30 void setX( Count &c, int val )
31 {
32     c.x = val ; // allowed because setX is a friend of Count
33 } // end function setX
34
35 int main()
36 {
37     Count counter; // create Count object
38
39     cout << "counter.x after instantiation: ";
40     counter.print();
41
42     setX( counter, 8 ); // set x using a friend function
43     cout << "counter.x after call to setX friend function: ";
44     counter.print();
45     return 0;
46 } // end main
```

friend function can modify **Count**'s private data

Calling a **friend** function; note that we pass the **Count** object to the function

```
counter.x after instantiation: 0
counter.x after call to setX friend function: 8
```

© 2007 Pearson Ed -All rights reserved.

# friend Function Example

```
1 // Fig. 10.16: fig10_16.cpp
2 // Non-friend/non-member functions cannot access private data of a class.
3 #include <iostream>
4 using std::cout;
5 using std::endl;
6
7 // Count class definition (note that there is no friendship declaration)
8 class Count
9 {
10 public:
11     // constructor
12     Count()
13         : x( 0 ) // initialize x to 0
14     {
15         // empty body
16     } // end constructor Count
17
18     // output x
19     void print() const
20     {
21         cout << x << endl;
22     } // end function print
23 private:
24     int x; // data member
25 }; // end class Count
```

© 2007 Pearson Ed -All rights reserved.

# friend Function Example

```
26
27 // function cannotSetX tries to modify private data of Count,
28 // but cannot because the function is not a friend of Count
29 void cannotSetX( Count &c, int val )
30 {
31     c.x = val; // ERROR: cannot access private member in Count
32 } // end function cannotSetX
33
34 int main()
35 {
36     Count counter; // create Count object
37
38     cannotSetX( counter, 3 ); // cannotSetX is not a friend
39     return 0;
40 } // end main
```

Non-**friend** function cannot access the class's **private** data

# 21.5 Using the `this` Pointer

- Member functions know which object's data members to manipulate.
  - Every object has access to its own address through a pointer called `this` (a C++ keyword).
  - An object's `this` pointer is not part of the object itself.
  - The `this` pointer is passed (by the compiler) as an implicit argument to each of the object's `non-static` member functions.

# 21.5 Using the `this` Pointer

- Objects use the `this` pointer implicitly or explicitly.
  - Used implicitly when accessing members directly.
  - Used explicitly when using keyword `this`.
  - Type of the `this` pointer depends on the type of the object and whether the executing member function is declared `const`.

© 2007 Pearson Ed -All rights reserved.

# this Example

```
1 // Fig. 21.17: fig21_17.cpp
2 // Using the this pointer to refer to object members.
3 #include <iostream>
4 using std::cout;
5 using std::endl;
6
7 class Test
8 {
9 public:
10     Test( int = 0 ); // default constructor
11     void print() const;
12 private:
13     int x;
14 }; // end class Test
15
16 // constructor
17 Test::Test( int value )
18     : x( value ) // initialize x to value
19 {
20     // empty body
21 } // end constructor Test
```

© 2007 Pearson Ed -All rights reserved.

# this Example

```
22
23 // print x using Implicit and explicit this pointers;
24 // the parentheses around *this are required
25 void Test::print() const
26 {
27     // Implicitly use the this pointer to access the member x
28     cout << "    x = " << x;
29
30     // explicitly use the this pointer and the arrow operator
31     // to access the member x
32     cout << "\n this->x = " << this->x;
33
34     // explicitly use the dereferenced this pointer and
35     // the dot operator to access the member x
36     cout << "\n(*this).x = " << (*this).x << endl;
37 } // end function print
38
39 int main()
40 {
41     Test testObject( 12 ); // instantiate and initialize testObject
42
43     testObject.print();
44     return 0;
45 } // end main
```

Implicitly using the **this** pointer to access member **x**

Explicitly using the **this** pointer to access member **x**

Using the dereferenced **this** pointer and the dot operator

```
    x = 12
  this->x = 12
(*this).x = 12
```

© 2007 Pearson Ed -All rights reserved.

# Common Programming Error 21.7

- Attempting to use the member selection operator ( . ) with a **pointer** to an object is a compilation error—the dot member selection operator may be used only with an **lvalue such as an object's name**, a reference to an object or a dereferenced pointer to an object.

© 2007 Pearson Ed -All rights reserved.

# Using the `this` Pointer

- Cascaded member-function calls
  - Multiple functions are invoked in the same statement.
  - Enabled by member functions returning the dereferenced `this` pointer
  - Example
    - `t.setMinute( 30 ).setSecond( 22 );`
      - Calls `t.setMinute( 30 );`
      - Then calls `t.setSecond( 22 );`

# Cascading Function Calls using this Pointer

```
1 // Fig. 21.18: Time.h
2 // Cascading member function calls.
3
4 // Time class definition.
5 // Member functions defined in Time.cpp.
6 #ifndef TIME_H
7 #define TIME_H
8
9 class Time
10 {
11 public:
12     Time( int = 0, int = 0, int = 0 ); // default constructor
13
14     // set functions (the Time & return types enable cascading)
15     Time &setTime( int, int, int ); // set hour, minute, second
16     Time &setHour( int ); // set hour
17     Time &setMinute( int ); // set minute
18     Time &setSecond( int ); // set second
```

*set* functions return **Time** & to enable cascading

© 2007 Pearson Ed -All rights reserved.

# Cascading Function Calls using this Pointer

```
19
20 // get functions (normally declared const)
21 int getHour() const; // return hour
22 int getMinute() const; // return minute
23 int getSecond() const; // return second
24
25 // print functions (normally declared const)
26 void printUniversal() const; // print universal time
27 void printStandard() const; // print standard time
28 private:
29 int hour; // 0 - 23 (24-hour clock format)
30 int minute; // 0 - 59
31 int second; // 0 - 59
32 }; // end class Time
33
34 #endif
```

© 2007 Pearson Ed -All rights reserved.

# Cascading Function Calls using this Pointer

```
1 // Fig. 21.19: Time.cpp
2 // Member-function definitions for Time class.
3 #include <iostream>
4 using std::cout;
5
6 #include <iomanip>
7 using std::setfill;
8 using std::setw;
9
10 #include "Time.h" // Time class definition
11
12 // constructor function to initialize private data;
13 // calls member function setTime to set variables;
14 // default values are 0 (see class definition)
15 Time::Time( int hr, int min, int sec )
16 {
17     setTime( hr, min, sec );
18 } // end Time constructor
19
20 // set values of hour, minute, and second
21 Time &Time::setTime( int h, int m, int s ) // note Time & return
22 {
23     setHour( h );
24     setMinute( m );
25     setSecond( s );
26     return *this; // enables cascading
27 } // end function setTime
```

Returning dereferenced **this** pointer enables cascading

# Cascading Function Calls using this Pointer

```
28
29 // set hour value
30 Time &Time::setHour( int h ) // note Time & return
31 {
32     hour = ( h >= 0 && h < 24 ) ? h : 0; // validate hour
33     return *this; // enables cascading
34 } // end function setHour
35
36 // set minute value
37 Time &Time::setMinute( int m ) // note Time & return
38 {
39     minute = ( m >= 0 && m < 60 ) ? m : 0; // validate minute
40     return *this; // enables cascading
41 } // end function setMinute
42
43 // set second value
44 Time &Time::setSecond( int s ) // note Time & return
45 {
46     second = ( s >= 0 && s < 60 ) ? s : 0; // validate second
47     return *this; // enables cascading
48 } // end function setSecond
49
50 // get hour value
51 int Time::getHour() const
52 {
53     return hour;
54 } // end function getHour
```

© 2007 Pearson Ed -All rights reserved.

# Cascading Function Calls using this Pointer

```
55
56 // get minute value
57 int Time::getMinute() const
58 {
59     return minute;
60 } // end function getMinute
61
62 // get second value
63 int Time::getSecond() const
64 {
65     return second;
66 } // end function getSecond
67
68 // print Time in universal-time format (HH:MM:SS)
69 void Time::printUniversal() const
70 {
71     cout << setfill( '0' ) << setw( 2 ) << hour << ":"
72         << setw( 2 ) << minute << ":" << setw( 2 ) << second;
73 } // end function printUniversal
74
75 // print Time in standard-time format (HH:MM:SS AM or PM)
76 void Time::printStandard() const
77 {
78     cout << ( ( hour == 0 || hour == 12 ) ? 12 : hour % 12 )
79         << ":" << setfill( '0' ) << setw( 2 ) << minute
80         << ":" << setw( 2 ) << second << ( hour < 12 ? " AM" : " PM" );
81 } // end function printStandard
```

© 2007 Pearson Ed -All rights reserved.

# Cascading Function Calls using this Pointer

```
1 // Fig. 21.20: fig21_20.cpp
2 // Cascading member function calls with the this pointer.
3 #include <iostream>
4 using std::cout;
5 using std::endl;
6
7 #include "Time.h" // Time class definition
8
9 int main()
10 {
11     Time t; // create Time object
12
13     // cascaded function calls
14     t.setHour( 18 ).setMinute( 30 ).setSecond( 22 );
15
16     // output time in universal and standard formats
17     cout << "Universal time: ";
18     t.printUniversal();
19
20     cout << "\nStandard time: ";
21     t.printStandard();
22
23     cout << "\n\nNew standard time: ";
24
25     // cascaded function calls
26     t.setTime( 20, 20, 20 ).printStandard();
27     cout << endl;
28     return 0;
29 } // end main
```

Cascaded function calls using the reference returned by one function call to invoke the next

Note that these calls must appear in the order shown, because **printStandard** does not return a reference to **t**

# 21.6 Dynamic Memory

## Management: Operators `new` and `delete`

- Dynamic memory management
  - Enables programmers to allocate and deallocate memory for any built-in or user-defined type.
  - Performed by operators `new` and `delete`.
  - For example, dynamically allocating memory for an array instead of using a fixed-size array.

© 2007 Pearson Ed -All rights reserved.

# Operators new and delete

- Operator `new`
  - Allocates (i.e., reserves) storage of the proper size for an object at execution time
  - Calls a constructor to initialize the object.
  - Returns a pointer of the type specified to the right of `new`.
  - Can be used to dynamically allocate any fundamental type (such as `int` or `double`) or any class type.
- The Free store (referred to as the heap)
  - Region of memory assigned to each program for storing objects created at execution time.

Example:

```
Time *timePtr  
timePtr = new Time;
```

© 2007 Pearson Ed -All rights reserved.

# Operators new and delete

## . Operator `delete`

- Destroys a dynamically allocated object.
- Calls the destructor for the object.
- Deallocates (i.e., releases) memory from the free store.
- The memory can then be reused by the system to allocate other objects.

Example:

```
delete timePtr;
```

© 2007 Pearson Ed -All rights reserved.

# Operators new and delete

- Initializing an object allocated by **new**
  - Initializer for a newly created fundamental-type variable.
    - Example
      - `double *ptr = new double( 3.14159 );`
  - Specify a comma-separated list of arguments to the constructor of an object.
    - Example
      - `Time *timePtr = new Time( 12, 45, 0 );`

© 2007 Pearson Ed -All rights reserved.

# Operators new and delete

- **new** operator can be used to allocate arrays dynamically.

- Dynamically allocate a 10-element integer array:

```
int *gradesArray = new int[ 10 ];
```

- Size of a dynamically allocated array
  - Specified using any integral expression that can be evaluated at execution time.

```
mulePtr *Mule = new Mules[mules_in];
```

# Operators new and delete

- Delete a dynamically allocated array:

```
delete [] gradesArray;
```

- This deallocates the array to which `gradesArray` points.
- If the pointer points to an array of objects,
  - It first calls the destructor for every object in the array.
  - Then it deallocates the memory.
- If the statement did not include the square brackets (`[]`) and `gradesArray` pointed to an array of objects
  - Only the first object in the array would have a destructor call.

# 21.7 static Class Members

- **static** data member
  - Only one copy of a variable shared by all objects of a class.
    - The member is “Class-wide” information.
    - A property of the class shared by all instances, not a property of a specific object of the class.
  - Declaration begins with keyword **static**

# static Class Members

## . Example

- Video game with Martians and other space creatures
  - Each **Martian** needs to know the **martianCount**.
  - **martianCount** should be **static** class-wide data.
  - Every **Martian** can access **martianCount** as if it were a data member of that **Martian**
  - Only one copy of **martianCount** exists.
- May seem like global variables but static has class scope.
- Can be declared **public**, **private** or **protected**.

© 2007 Pearson Ed -All rights reserved.

# static Class Members

- Fundamental-type **static** data members
  - Initialized by default to 0.
  - If you want a different initial value, a static data member can be initialized once (and only once).
- **const static** data member of **int** or **enum** type
  - Can be initialized in its declaration in the class definition.
- All other **static** data members
  - Must be defined at file scope (i.e., outside the body of the class definition)
  - Can be initialized only in those definitions.
- **static** data members of class types (i.e., **static** member objects) that have default constructors
  - Need not be initialized because their default constructors will be called.

© 2007 Pearson Ed -All rights reserved.

# static Class Members

- Exists even when no objects of the class exist.
  - To access a **public static** class member when no objects of the class exist.
    - Prefix the class name and the binary scope resolution operator (**::**) to the name of the data member.
      - Example
        - » **Martian::martianCount**
  - Also accessible through any object of that class
    - Use the object's name, the dot operator and the name of the member.
      - Example
        - » **myMarian.martianCount**

© 2007 Pearson Ed -All rights reserved.

# static Class Members

- **static** member function
  - **Is a service of the class**, not of a specific object of the class.
- **static** is applied to an item at file scope.
  - That item becomes known only in that file.
  - The **static** members of the class need to be available from any client code that accesses the file.
    - **So we cannot declare them static in the .cpp file—we declare them static only in the .h file.**

# static class member Example

```
1 // Fig. 21.21: Employee.h
2 // Employee class definition.
3 #ifndef EMPLOYEE_H
4 #define EMPLOYEE_H
5
6 class Employee
7 {
8 public:
9     Employee( const char * const, const char * const ); // constructor
10    ~Employee(); // destructor
11    const char *getFirstName() const; // return first name
12    const char *getLastName() const; // return last name
13
14    // static member function
15    static int getCount(); // return number of objects instantiated
16 private:
17    char *firstName;
18    char *lastName;
19
20    // static data
21    static int count; // number of objects instantiated
22 }; // end class Employee
23
24 #endif
```

Function prototype for **static** member function

**static** data member keeps track of number of **Employee** objects that currently exist

© 2007 Pearson Ed -All rights reserved.

# static class member Example

```
1 // Fig. 21.22: Employee.cpp
2 // Member-function definitions for class Employee.
3 #include <iostream>
4 using std::cout;
5 using std::endl;
6
7 #include <cstring> // strlen and strcpy prototypes
8 using std::strlen;
9 using std::strcpy;
10
11 #include "Employee.h" // Employee class definition
12
13 // define and initialize static data member at file scope
14 int Employee::count = 0;
15
16 // define static member function that returns number of
17 // Employee objects instantiated (declared static in Employee.h)
18 int Employee::getCount()
19 {
20     return count;
21 } // end static function getCount
```

**static** data member is defined and initialized at file scope in the **.cpp** file

**static** member function can access only **static** data, because the function might be called when no objects exist

© 2007 Pearson Ed -All rights reserved.

# static class member Example

```
22
23 // constructor dynamically allocates space for first and last name and
24 // uses strcpy to copy first and last names into the object
25 Employee::Employee( const char * const first, const char * const last )
26 {
27     firstName = new char[ strlen( first ) + 1 ];
28     strcpy( firstName, first );
29
30     lastName = new char[ strlen( last ) + 1 ];
31     strcpy( lastName, last );
32
33     count++; // increment static count of employees
34
35     cout << "Employee constructor for " << firstName
36         << ' ' << lastName << " called." << endl;
37 } // end Employee constructor
38
39 // destructor deallocates dynamically allocated memory
40 Employee::~Employee()
41 {
42     cout << "~Employee() called for " << firstName
43         << ' ' << lastName << endl;
44
45     delete [] firstName; // release memory
46     delete [] lastName; // release memory
47
48     count--; // decrement static count of employees
49 } // end ~Employee destructor
```

Dynamically allocating **char** arrays

Non-**static** member function (i.e., constructor) can modify the class's **static** data members

Deallocating memory reserved for arrays

© 2007 Pearson Ed -All rights reserved.

# static class member Example

```
50
51 // return first name of employee
52 const char *Employee::getFirstName() const
53 {
54     // const before return type prevents client from modifying
55     // private data; client should copy returned string before
56     // destructor deletes storage to prevent undefined pointer
57     return firstName;
58 } // end function getFirstName
59
60 // return last name of employee
61 const char *Employee::getLastName() const
62 {
63     // const before return type prevents client from modifying
64     // private data; client should copy returned string before
65     // destructor deletes storage to prevent undefined pointer
66     return lastName;
67 } // end function getLastName
```

© 2007 Pearson Ed -All rights reserved.

# static class member Example

```
1 // Fig. 21.23: fig21_23.cpp
2 // Driver to test class Employee.
3 #include <iostream>
4 using std::cout;
5 using std::endl;
6
7 #include "Employee.h" // Employee class definition
8
9 int main()
10 {
11     // use class name and binary scope resolution operator to
12     // access static member function getCount
13     cout << "Number of employees before instantiation of any objects is "
14         << Employee::getCount() << endl; // use class name
15
16     // use new to dynamically create two new Employees
17     // operator new also calls the object's constructor
18     Employee *e1Ptr = new Employee( "Susan", "Baker" );
19     Employee *e2Ptr = new Employee( "Robert", "Jones" );
20
21     // call getCount on first Employee object
22     cout << "Number of employees after objects are instantiated is "
23         << e1Ptr->getCount();
24
25     cout << "\n\nEmployee 1: "
26         << e1Ptr->getFirstName() << " " << e1Ptr->getLastName()
27         << "\nEmployee 2: "
28         << e2Ptr->getFirstName() << " " << e2Ptr->getLastName() << "\n\n";
```

Calling **static** member function using class name and binary scope resolution operator

Dynamically creating **Employees** with **new**

Calling a **static** member function through a pointer to an object of the class

© 2007 Pearson Ed -All rights reserved.

# static class member Example

```
29
30 delete e1Ptr; // deallocate memory
31 e1Ptr = 0; // disconnect pointer from free-store space
32 delete e2Ptr; // deallocate memory
33 e2Ptr = 0; // disconnect pointer from free-store space
34
35 // no objects exist, so call Employee::getCount()
36 // using the class name and the binary scope resolution operator
37 cout << "Number of employees after objects are deleted is "
38     << Employee::getCount() << endl;
39 return 0;
40 } // end main
```

Releasing memory to which a pointer points

Disconnecting a pointer from any space in memory

Number of employees before instantiation of any objects is 0  
Employee constructor for Susan Baker called.  
Employee constructor for Robert Jones called.  
Number of employees after objects are instantiated is 2

Employee 1: Susan Baker  
Employee 2: Robert Jones

~Employee() called for Susan Baker  
~Employee() called for Robert Jones  
Number of employees after objects are deleted is 0

© 2007 Pearson Ed -All rights reserved.

# static Class Members

- Declare a member function **static**
  - If it does not access non-**static** data members or non-**static** member functions of the class.
- A **static** member function does not have a **this** pointer.
- **static** data members and **static** member functions exist independently of any objects of a class.
- When a **static** member function is called, there might not be any objects of its class in memory.

# Abstract data types (ADTs)

- Essentially ways of representing real-world notions to some satisfactory level of precision within a computer system.
- Types like `int`, `double`, `char` and others are all ADTs.
  - e.g., `int` is an abstract representation of an integer.
- Captures two notions:
  - Data representation
  - Operations that can be performed on the data.
- **C++ classes implement ADTs and their services.**

# Array Abstract Data Type

- Many array operations not built into C++
  - e.g., subscript range checking
- Programmers can develop an array ADT as a class that is preferable to “raw” arrays
  - Can provide many helpful new capabilities
- C++ Standard Library class template **vector**.

# Summary

- **const** objects and **const** member functions
- Member Composition Example
- Friend function Example
- **this** pointer Example
- Dynamic memory management
  - **new** and **delete** operators
- **static** class members
- Abstract Data Types
