

Functions

Systems Programming

Functions

- Simple Function Example
- Function Prototype and Declaration
- Math Library Functions
- Function Definition
- Header Files
- Random Number Generator
- Call by Value and Call by Reference
- Scope (global and local)
- Call by Value Example
- Static Variables

Simple Function Example

```
char isalive ( int i)
{
  if (i > 0)
    return 'A';
  else
    return 'D';
}
int main ()
{
  int Peter, Paul, Mary, Tom;

  Peter = -2; Paul = 0; Mary = 1; Tom = 2;

  printf("Peter is %c Paul is %c\nMary is %c Tom is %c\n",
        isalive (Peter), isalive (Paul),
        isalive (Mary), isalive (Tom));
  return 0;
}
```

main

- C programs start execution at main.
 - is simply another function.
- All functions have a return value.

./dora

Peter is D Paul is D
Mary is A Tom is A

Function Declarations

```
char isalive ( int i);
```

```
int main ()
```

```
{  
  int Peter, Paul, Mary, Tom;
```

```
Peter = -2; Paul = 0; Mary = 1; Tom = 2;
```

```
printf("Peter is %c Paul is %c\nMary is %c Tom is %c\n",  
       isalive (Peter), isalive (Paul),  
       isalive (Mary), isalive (Tom));
```

```
return 0;
```

```
}
```

```
char isalive ( int i)
```

```
{  
  if (i > 0)  
    return 'A';  
  else  
    return 'D';  
}
```

function prototype

function placed after reference

5.2 Program Modules in C

- **Functions** { also referred to as routines or subroutines}
 - Modules in C
 - Programs combine user-defined functions with library functions.
 - C standard library has a wide variety of functions.
- **Function calls**
 - **Invoking functions**
 - Provide function name and arguments (data).
 - Function performs operations or manipulations.
 - Function returns results.

© 2007 Pearson Ed -All rights reserved.

5.3 Math Library Functions

- Math library functions
 - perform common mathematical calculations.
 - `#include <math.h>`
- Format for calling functions
 - `FunctionName(argument);`
 - If multiple arguments, use comma-separated list.
 - `printf("%.2f", sqrt(900.0));`
 - Calls function `sqrt`, which returns the square root of its argument.
 - All math functions return data type `double`.
 - Arguments may be constants, variables, or expressions.

Fig. 5.2 Commonly used math library functions. (Part 1)

Function	Description	Example
<code>sqrt(x)</code>	square root of x	<code>sqrt(900.0)</code> is 30.0 <code>sqrt(9.0)</code> is 3.0
<code>exp(x)</code>	exponential function e^x	<code>exp(1.0)</code> is 2.718282 <code>exp(2.0)</code> is 7.389056
<code>log(x)</code>	natural logarithm of x (base e)	<code>log(2.718282)</code> is 1.0 <code>log(7.389056)</code> is 2.0
<code>log10(x)</code>	logarithm of x (base 10)	<code>log10(1.0)</code> is 0.0 <code>log10(10.0)</code> is 1.0 <code>log10(100.0)</code> is 2.0
<code>fabs(x)</code>	absolute value of x	<code>fabs(5.0)</code> is 5.0 <code>fabs(0.0)</code> is 0.0 <code>fabs(-5.0)</code> is 5.0
<code>ceil(x)</code>	rounds x to the smallest integer not less than x	<code>ceil(9.2)</code> is 10.0 <code>ceil(-9.8)</code> is -9.0

© 2007 Pearson Ed -All rights reserved.

Fig. 5.2 Commonly used math library functions. (Part 2)

Function	Description	Example
<code>floor(x)</code>	rounds x to the largest integer not greater than x	<code>floor(9.2)</code> is 9.0 <code>floor(-9.8)</code> is -10.0
<code>pow(x, y)</code>	x raised to power y (x^y)	<code>pow(2, 7)</code> is 128.0 <code>pow(9, .5)</code> is 3.0
<code>fmod(x, y)</code>	remainder of x/y as a floating-point number	<code>fmod(13.657, 2.333)</code> is 1.992
<code>sin(x)</code>	trigonometric sine of x (x in radians)	<code>sin(0.0)</code> is 0.0
<code>cos(x)</code>	trigonometric cosine of x (x in radians)	<code>cos(0.0)</code> is 1.0
<code>tan(x)</code>	trigonometric tangent of x (x in radians)	<code>tan(0.0)</code> is 0.0

5.4 Functions

- **Functions**
 - Modularize a program.
 - All variables defined inside functions are local variables.
 - Known only in function defined.
 - Parameters
 - Communicate information between functions.
 - Local variables
- **Benefits of functions**
 - Software reusability
 - Use existing functions as building blocks for new programs.
 - Abstraction - hide internal details (library functions).
 - Avoid code repetition

5.5 Function Definitions

Function definition format

```
return-value-type function-name( parameter-list )  
{  
    declarations and statements  
}
```

- Function-name: any valid identifier
- Return-value-type: data type of the result (default `int`)
 - `void` - indicates that the function returns nothing.
- Parameter-list: comma separated list, declares parameters
 - A type must be listed explicitly for each parameter unless, the parameter is of type `int`.

5.5 Function Definitions

Function definition format (continued)

```
return-value-type function-name( parameter-list )  
{  
    declarations and statements  
}
```

- Definitions and statements: function body (block)
 - Variables can be defined inside blocks (can be nested).
 - **Functions can not be defined inside other functions!**
- Returning control
 - If nothing returned
 - return;
 - or, until reaches right brace
 - If something returned
 - return *expression*;

5.6 Function Prototypes

- Function prototype
 - Function name
 - Parameters - what the function takes in.
 - Return type - data type function returns. (default `int`)
 - Used to validate functions.
 - Prototype only needed if function definition comes after use in program.
- Promotion rules and conversions
 - Converting to lower types can lead to errors.

© 2007 Pearson Ed -All rights reserved.

Fig. 5.5 Promotion hierarchy

Data type	printf conversion specification	scanf conversion specification
Long double	%Lf	%Lf
double	%f	%lf
float	%f	%f
Unsigned long int	%lu	%lu
Long int	%ld	%ld
unsigned int	%u	%u
int	%d	%d
unsigned short	%hu	%hu
short	%hd	%hd
char	%c	%c

5.7 Function Call Stack and Activation Records

Program execution stack

- A stack is a last-in, first-out (LIFO) data structure.
 - Anything put into the stack is placed “on top”.
 - The only data that can be taken out is the data on top.
- C uses a program execution stack to keep track of which functions have been called.
 - When a function is called, it is placed on top of the stack.
 - When a function ends, it is taken off the stack and control returns to the function immediately below it.
- Calling more functions than C can handle at once is known as a “stack overflow error”.

5.8 Headers

- Header files
 - Contain function prototypes for library functions.
 - e. g. , `<stdlib.h>` , `<math.h>`
 - Load with `#include <filename>`
`#include <math.h>`
- Custom header files
 - Create file with functions.
 - Save as `filename.h`
 - Load in other files with `#include "filename.h"`
 - This facilitates functions reuse.

Fig. 5.6 Standard library headers (Part 3)

Standard library header	Explanation
<stdi o. h>	Contains function prototypes for the standard input/output library functions, and information used by them.
<stdl i b. h>	Contains function prototypes for conversions of numbers to text and text to numbers, memory allocation, random numbers, and other utility functions.
<stri ng. h>	Contains function prototypes for string-processing functions.
<ti me. h>	Contains function prototypes and types for manipulating the time and date.

5.10 Random Number Generation

- **rand function**

- Load `<stdlib.h>`

- Returns "random" number between 0 and RAND_MAX (at least 32767).

- `i = rand();`

- Pseudorandom

- Preset sequence of "random" numbers

- Same sequence for every function call

- **Scaling**

- To get a random number between 1 and n.

- `1 + (rand() % n)`

- `rand() % n` returns a number between 0 and $n - 1$.

- Add 1 to make random number between 1 and n.

- `1 + (rand() % 6)`

- number between 1 and 6

© 2007 Pearson Ed -All rights reserved.

Random Number Example

```
1 /* Fig. 5.7: flg05_07.c
2     Shifted, scaled integers produced by 1 + rand() % 6 */
3 #include <stdio.h>
4 #include <stdlib.h>
5
6 /* function main begins program execution */
7 int main( void )
8 {
9     int i; /* counter */
10
11     /* loop 20 times */
12     for ( i = 1; i <= 20; i++ ) {
13
14         /* pick random number from 1 to 6 and output it */
15         printf( "%10d", 1 + ( rand() % 6 ) );
16
17         /* if counter is divisible by 5, begin new line of output */
18         if ( i % 5 == 0 ) {
19             printf( "\n" );
20         } /* end if */
21
22     } /* end for */
23
24     return 0; /* indicates successful termination */
25
26 } /* end main */
```

Generates a random number between 1 and 6

6	6	5	5	6
5	1	1	5	3
6	6	2	4	2
6	2	3	4	1

Call by Value

- When arguments are passed by the calling routine to the called routine **by value**,
 - A copy of the argument is passed to the called routing.
 - Hence, any changes made to the passed argument by the called routine **DO NOT** change the original argument in the calling routine.
 - This avoids accidental changes known as *side-effecting*.

Call by Reference

- When arguments are passed by the calling routine to the called routine **by reference**,
 - The original argument is passed to the called routing.
 - Hence, any changes made to the passed argument means that this changes remain in effect when control is returned to the calling routine.

Scope (simple)

- In C, the scope of a declared variable or type is defined within the range of the **block** of code in which the declaration is made.
- Two simple examples:
 1. declarations outside all functions are called **globals**. They can be referenced and modified by ANY function.
{Note - this violates good programming practice rules}.

Scope (simple)

2. **Local** variables - declarations made inside a function mean that variable name is defined only within the scope of that function.
 - Variables with the same name outside the function are different.
 - Every time the function is invoked the value of local variables need to re-initialized upon entry to the function.
 - Local variables have the automatic storage duration by default (implicit).

```
auto double x, y    /* explicit */
```

Call by Value Example

```
/* Example shows call-by-value and the scope of a global variable 'out' */
```

```
int out = 100; /* out is global variable */
```

```
/* byval modifies local, global and variables passed by value. */
```

```
int byval ( int i, int j)
```

```
{
```

```
  int tmp;
```

```
  tmp = 51;
```

```
  i = tmp - 10*i - j;
```

```
  out = 2*out + i + j;
```

```
  j++;
```

```
  tmp++;
```

```
  printf("In byval: i = %2d, j = %2d, tmp = %2d, out = %3d\n",
```

```
        i, j, tmp, out);
```

```
  return i;
```

```
}
```

global is changed

Call by Value Example (cont)

```
int main ()
{
  int i, j, tmp, s;

  tmp = 77;
  j = 1;

  for (i = 0; i < 2; i++)
  {
    s = byval(i,j);
    out = out + s - j; ← global is changed
    printf("In main : i = %2d, j = %2d, tmp = %2d, out = %3d, s = %d\n",
          i, j, tmp, out, s);
  }
  return 0;
}
```

Call by Value Example

```
int main ()
{
  int i, j, tmp, s;

  tmp = 77;
  j = 1;
```

```
  for (i = 0; i < 2; i++)
  {
    s = byval(i,j);
    out = out + s - j;
    printf("In main : i = %2d, j = %2d, tmp = %2d, out = %3d, s = %d\n",
          i, j, tmp, out, s);
  }
  return 0;
}
```

```
$/byval
```

```
In byval: i = 50, j = 2, tmp = 52, out = 251
```

```
In main : i = 0, j = 1, tmp = 77, out = 300, s = 50
```

```
In byval: i = 40, j = 2, tmp = 52, out = 641
```

```
In main : i = 1, j = 1, tmp = 77, out = 680, s = 40
```

Static Variables

- Local variables declared with the keyword **static** are still only known in the function in which they are defined.
- However, unlike automatic variables, static local variables retain their value when the function is exited.

e.g.,

```
static int count = 2;
```

- All numeric static variables are initialized to zero if not explicitly initialized.

Static Variables

```
/* An Example of a Static Variable */
```

```
float nonstat ( float x)
```

```
{
```

```
    int i = 1;
```

```
    i = 10*i;
```

```
    x = i - 5.0*x;
```

```
    return x;
```

```
}
```

```
float stat (float y)
```

```
{
```

```
    static int i = 1;
```

```
    i = 10*i;
```

```
    y = i - 5.0*y;
```

```
    return y;
```

```
}
```

Static Variables

```
int main()
{
    int i;
    float var1, var2;
    var2 = var1 = 2.0;
    printf(" var1 = %9.2f, var2 = %9.2f\n", var1, var2);

    for ( i = 1; i <= 3; i++)
    {
        var1 = nonstat(var1);
        var2 = stat(var2);
        printf(" var1 = %9.2f, var2 = %9.2f\n", var1, var2);
    }
    return 0;
}
```

```
$/static
```

```
var1 =      2.00, var2 =      2.00
var1 =      0.00, var2 =      0.00
var1 =     10.00, var2 =    100.00
var1 =    -40.00, var2 =    500.00
```

Summary

- The important concepts introduced in this Powerpoint session are:
 - Functions
 - Libraries
 - Header Files
 - Call by Value
 - Call by Reference
 - Scope (global and local)
 - Static Variables
