1. Come up with a sample input, and compute the results for your input
2. List subtasks
3. Outline your solution

A company maintains records on its employees. For each, it stores the person's name, which team they are on on, and how many days they have been out sick. The company tracks the health of each team by totalling the number of sick days across all members of the team.

Write a method leastHealthy that takes a list of employees and returns a list of the team names in order from the one with the most to the one with the least sick days. Here's a class of Employee to get you started.

```
class Employee {

    String name;

    String team;

    int missedDays;

}
```
