# Ethernet [DEC, Intel, Xerox]

- 1-persistent, CSMA-CD with Binary Exponential Backoff.
- Manchester encoding.

# Ethernet [operational in 1974]

Initially 3 Mbps baseband coaxial cable (thick Ethernet).

## Operational Description

- *Ethernet stations sense the channel (CS).*
- *When the channel is free, the station transmits a frame (1-persistent).*
- *The stations monitor the 'ether' during the transmission (MA).*
- *If a collision is detected by any station (CD), the transmission is terminated immediately and a jam signal is sent.*
- *Upon collision, transmitting stations backoff using a local counter and then retransmit (BEB).*

# Worst Case Collision Scenario

$$t_{prop} = d / v \text{ seconds}$$

Leon-Garcia & Widjaja:  
Communication Networks

# Ethernet

- A frame *seizes the channel* after  $2 t_{prop}$
- On 1 km Ethernet,  $t_{prop}$  is approximately 5 microseconds.
- Contention interval =  $2 t_{prop}$
- *Interframe gap = 9.6 microseconds*
- Modeled as *slotted scheme* with  
slot =  $2 t_{prop}$

# Model (slotted Bernoulli Trial)

Probability of 1 successful transmission:

$$P_{success} = np(1-p)^{n-1}$$

$P_{success}$  is maximized at  $p=1/n$ :

$$P_{success}^{\max} = n\left(1 - \frac{1}{n}\right)^{n-1} \rightarrow \frac{1}{e}$$

Tanenbaum

# Ethernet Performance

Efficiency of Ethernet at 10 Mbps with 512-bit slot times.

Tanenbaum

# Binary Exponential Backoff (BEB)

- Upon a collision, the **sending stations** increment a local counter **K**. The backoff interval is randomly selected using a uniform distribution over the  **$L = 2^K$**  slots.
- **K** is initially set to 0.
- Thus upon collision, the value of **L** is doubled locally for each **sending station**.

# Binary Exponential Backoff (BEB)

*Slotted ALOHA has been shown to be unstable when*

$$p > 1/n$$

Since Ethernet permits up to 1024 stations, backoff continues until  $K = 10$ ,  $L = 2^{10}$ , and  $p = 1/2^{10}$

Normally  $K$  is incremented up to 10, but BEB is set for 16 retries. After 16 retries, MAC gives up trying to send the frame.

{The IP packet is now considered lost}.

# IEEE 802.3 Frame Format

0	Single address
---	----------------

1	Group address
---	---------------

0	Local address
---	---------------

1	Global address
---	----------------

- Destination address is either single address or group address (broadcast = 111...111)

- Addresses are defined on local or universal basis
- $2^{46}$  possible global addresses

Leon-Garcia & Widjaja:  
*Communication Networks*

# Ethernet Frame Format

Note - a minimum

Leon-Garcia & Widjaja:  
Communication Networks

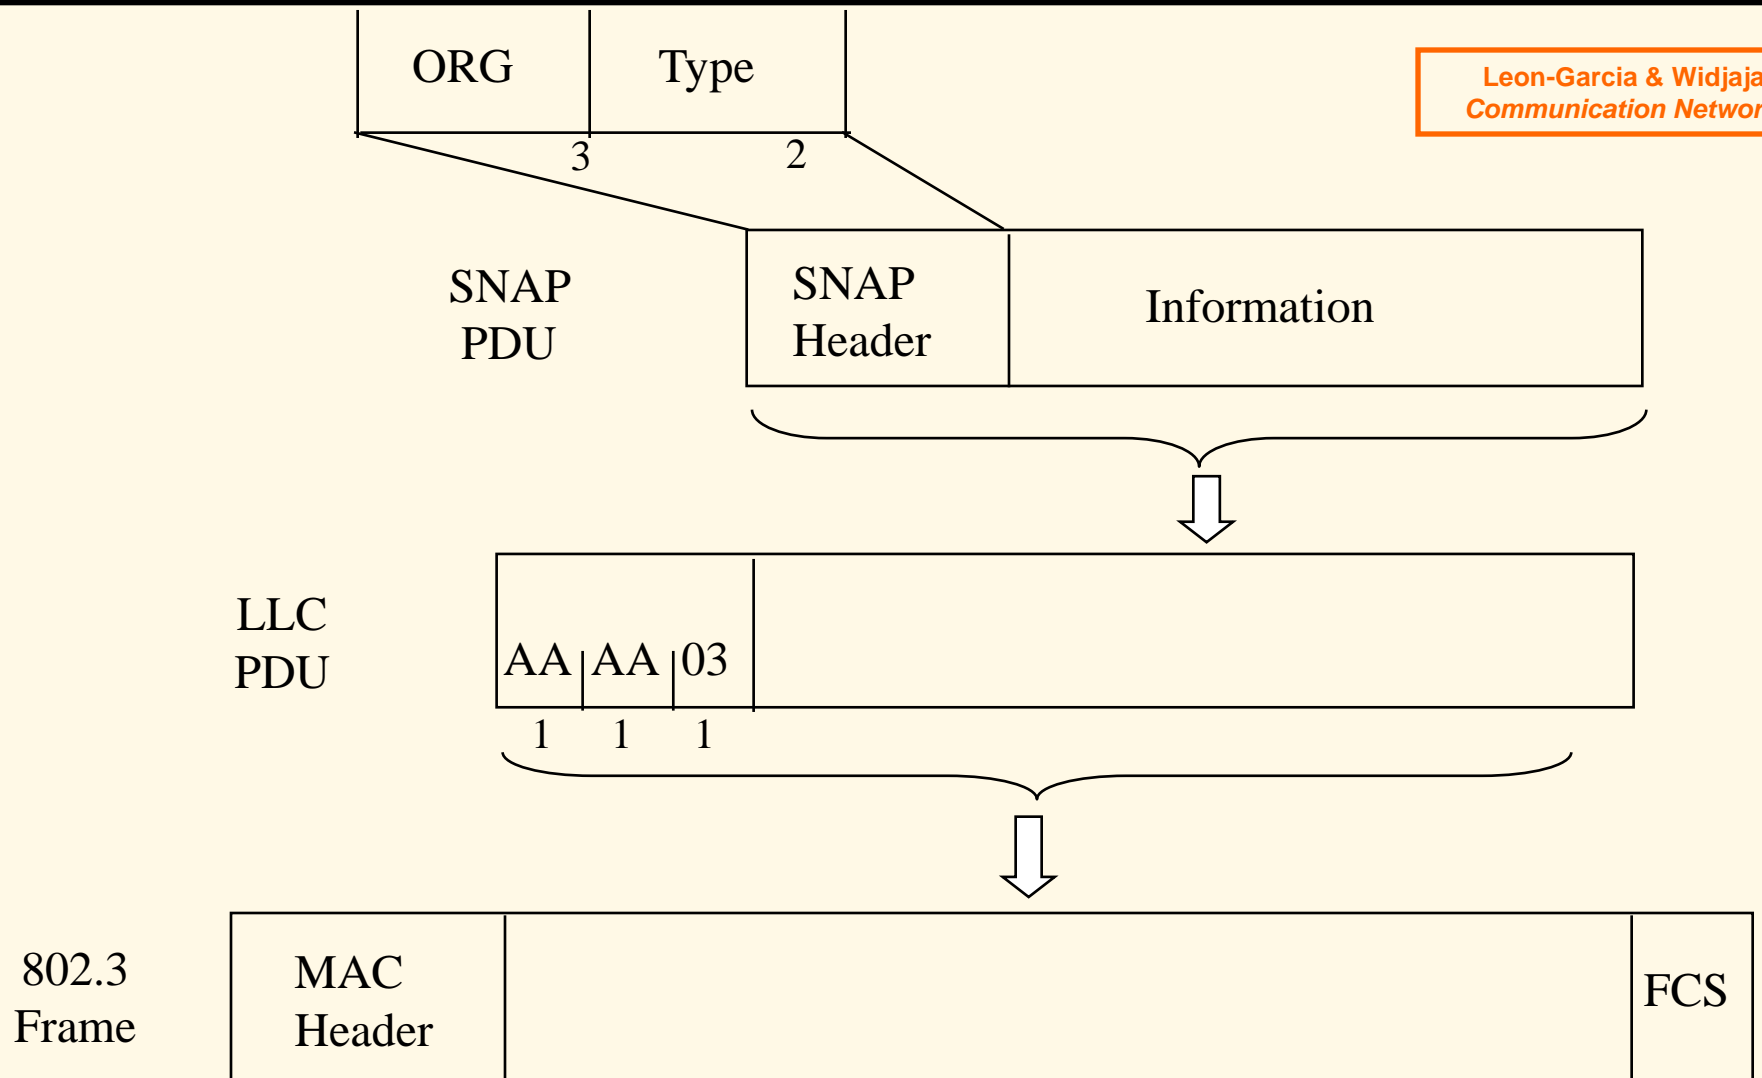

SFD = Start of frame delimiter  
 DA = Destination address  
 SA = Source address  
 FCS = Frame check sequence

*Communication Networks*

Figure 1.4 Lineage of Fast Ethernet

# Ethernet Evolution

## 10BASE5

{1983}

- 10 Mbps
- 500 meter segment length
- Signal-regenerating repeaters
- Thick Coax
  - *Advantages:* Low attenuation, excellent noise immunity, superior mechanical strength
  - *Disadvantages:* Bulky, difficult to pull, transceiver boxes too expensive
- \* **Wiring represented a significant part of total installed cost.**

# 10BASE5

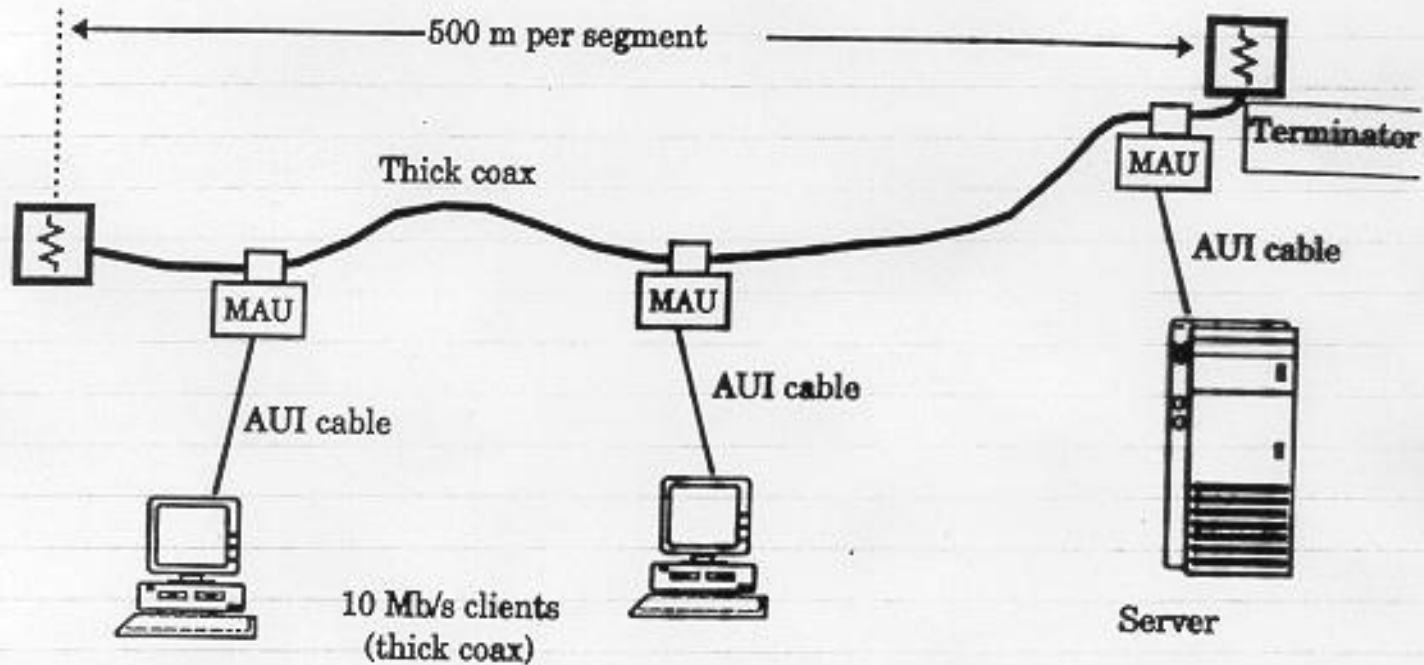

Figure 1.5 Thick Coax Installation

MAU device is physically hooked on main cable.

50 meter AUI cable from MAU to station.

# Ethernet Evolution

## 10BASE2 'Cheapernet'

{1985}

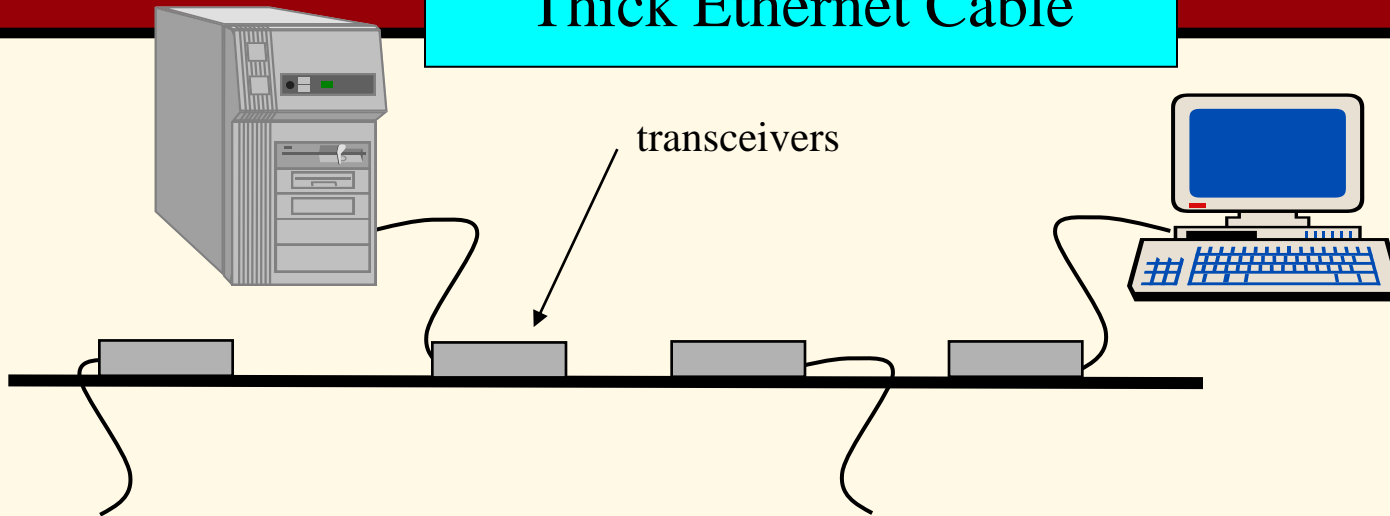

- 10 Mbps
- 185 meter segment length
- Signal-regenerating repeaters
- Transceiver was integrated onto the adapter
- Thin Coax (coax thinner and lighter)
  - *Advantages:* Easier to install, reduced hardware cost, BNC connectors widely deployed → lower installation costs.
  - *Disadvantages:* Higher attenuation and could not support as many stations due to signal reflection caused by BNC Tee Connector.

# Ethernet Evolution

## 1BASE5 StarLAN

{1987}

- 1 Mbps
- 250 meter segment length
- Signal-regenerating repeaters
- Transceiver integrated onto the adapter
- Hub-and-Spoke topology (star topology)
- **Two pairs of unshielded twisted pair**
  - *Advantages: Since four or more UTP are ubiquitous in buildings, it is easier to use installed wiring in the walls. Telephone wiring is hierarchical → can use wiring closets.*

# Ethernet Evolution

## 10BASE-T {1990} **\*\*Most popular**

- . 10 Mbps
- . 100 meter segment length
- . Signal-regenerating repeaters
- . Transceiver integrated onto adapter
- . Two pairs of UTP
- . **Hub-and-spoke topology {Hub in the closet}**
  - *Advantages:* could be done without pulling new wires. Each hub is a **repeater** - recovering the incoming signal, amplifying the signal and broadcasting it on all outgoing lines.

# The Hub Concept

- Separate transmit and receive pair of wires.
- The **repeater** in the hub retransmits the signal received from **any** input pair onto **ALL** output pairs.
- *Essentially, the hub emulates a broadcast channel with collisions detected by receiving nodes.*

# 10Base-T Hub Concept

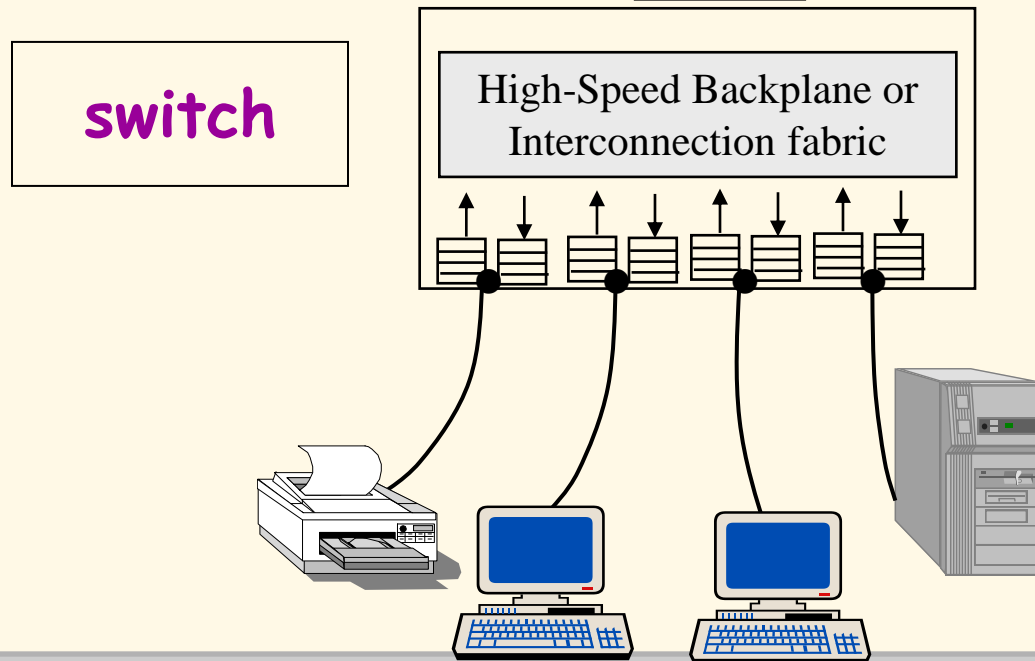

Figure 1.7 10BASE-T Hub-and-Spoke Architecture

# Twisted Pair Ethernet

# Switched Ethernet

- \***Basic idea:** improve on the Hub concept
- The switch *learns destination locations* by remembering the ports of the associated source address in a table.
- The switch may not have to broadcast to all output ports. It may be able to send the frame **only** to the destination port.
- → **a big performance advantage over a hub**, if more than one frame transfer can go through the switch concurrently.

# Switches

- **link-layer devices: smarter than hubs, take *active* role**
  - Store and forward Ethernet frames.
  - Examine incoming frame's MAC address, **selectively** forward frame to one-or-more outgoing links when frame is to be forwarded on segment, uses CSMA/CD to access segment.
- ***transparent***
  - hosts are unaware of presence of switches.
- ***plug-and-play, self-learning***
  - switches do not need to be configured.

K & R

# Switches

allows *multiple* simultaneous transmissions

- Hosts have dedicated, direct connection to switch.
- Switches buffer packets.
- Ethernet protocol used on **each** incoming link, but no collisions due to **full duplex**.
  - each link is its own collision domain.
- **switching**: A-to-A' and B-to-B' simultaneously, without collisions.
  - not possible with dumb hub!!

switch with six interfaces  
(1,2,3,4,5,6)

K & R

# Switch Table

- **Q:** How does switch know that A' is reachable via interface 4, B' is reachable via interface 5?
- **A:** Switch has a **switch table**, each entry:
  - (MAC address of host, interface to reach host, time stamp)
- looks like a routing table!
- **Q:** How are entries created, maintained in switch table?
  - something like a routing protocol?

switch with six interfaces  
(1,2,3,4,5,6)

K & R

# Switch: Self-Learning

- switch *learns* which hosts can be reached through which interfaces
  - when frame received, switch "learns" location of sender: incoming LAN segment.
  - records sender/location pair in switch table.

MAC addr	interface	TTL
A	1	60

Switch table  
(initially empty)

K & R

# Switch: Frame Filtering/Forwarding

When frame received at the switch:

K & R

1. Record link associated with sending host.
2. Index switch table using MAC destination address.
3. **if** entry found for destination **then**  
  {  
    **if** dest on segment from which frame arrived  
      **then** drop the frame  
      **else** forward the frame on interface indicated  
  }  
  **else** flood forward on all but the interface  
on which the frame arrived

# Self-learning, Forwarding: Example

- frame destination unknown: **flood**
- destination A location known: **selective send**

MAC addr	interface	TTL
A	1	60
A'	4	60

Switch table  
(initially empty)

K & R

# Interconnecting Switches

- Switches can be connected together.

- Q:** sending from A to G - how does S<sub>1</sub> know to forward frame destined to G via S<sub>4</sub> and S<sub>3</sub>?
- A:** self learning! (works exactly the same as in single-switch case!)

K & R

# Self-learning Multi-Switch

Suppose C sends frame to I, I responds to C

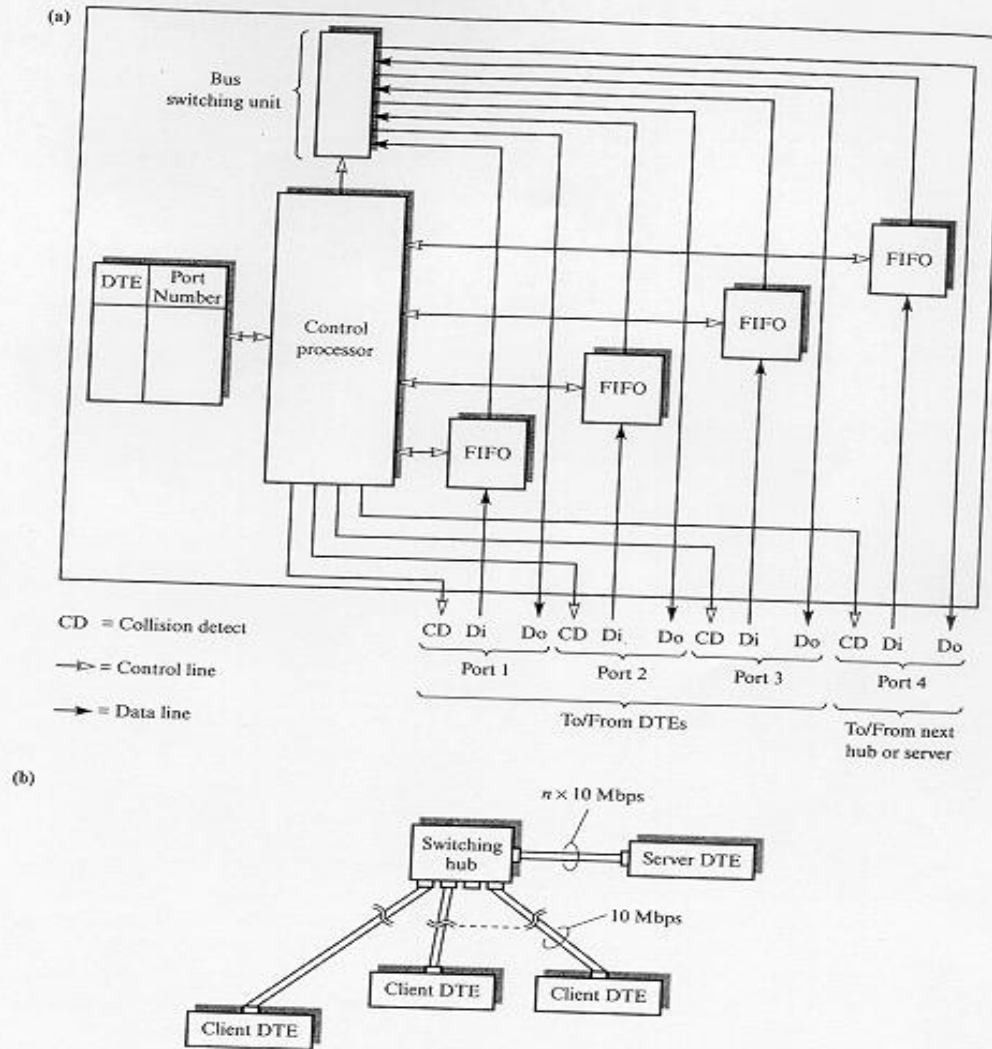

- Q: show switch tables and packet forwarding in S<sub>1</sub>, S<sub>2</sub>, S<sub>3</sub>, S<sub>4</sub>

K & R

# Switched Ethernet

- The advantage comes when the **switched Ethernet** backplane is able to repeat more than one frame **in parallel** (*a separate backplane bus line for each node*).
  - The frame is relayed onto the required output port via the port's own backplane bus line.
- Under this scheme **collisions are still possible** when two concurrently arriving frames are destined for the same station.
- Note - each parallel transmission can take place at 10 Mbps!!

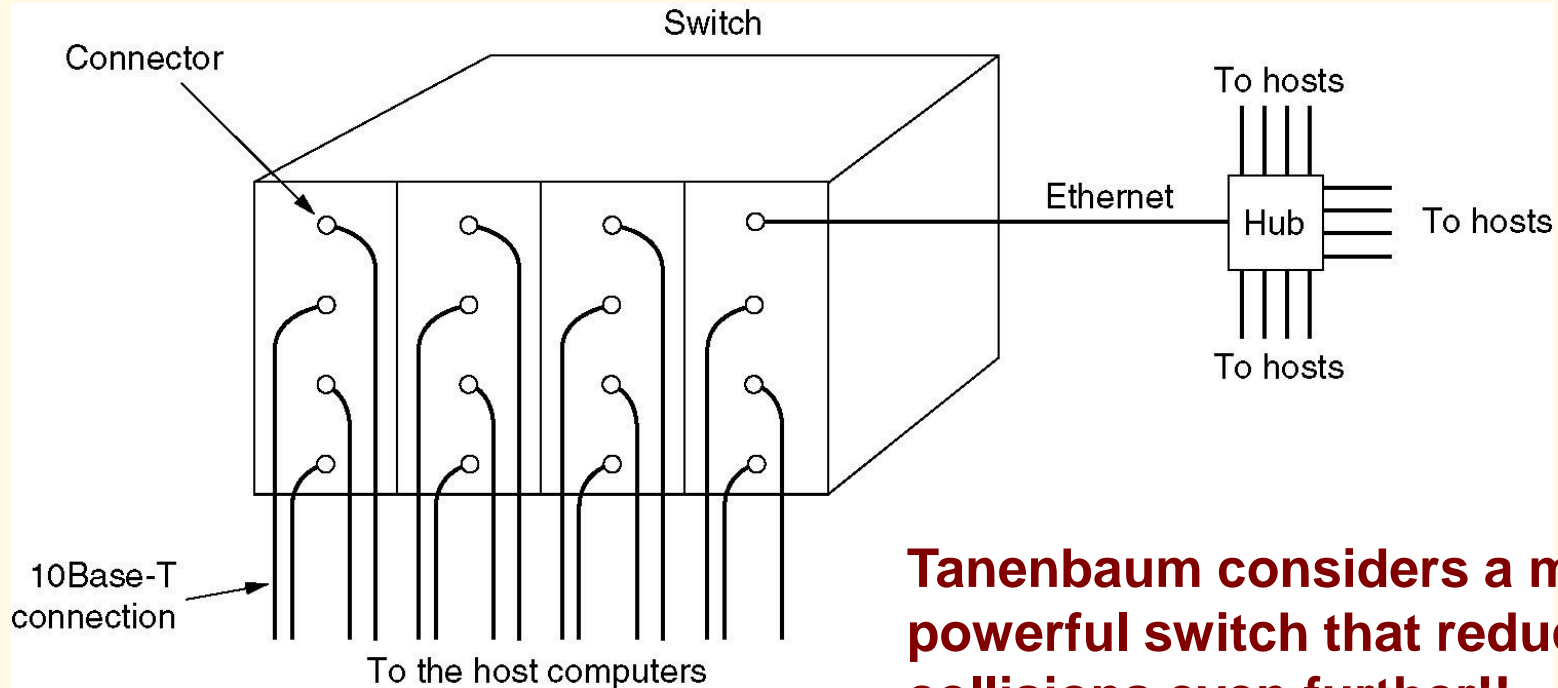

# Switched Ethernet

**Figure 7.2**  
Ethernet switching:  
(a) switching hub  
schematic;  
(b) switching hub  
derivative.

Halsall

# Switched Ethernet

**Tanenbaum considers a more powerful switch that reduces collisions even further!!**

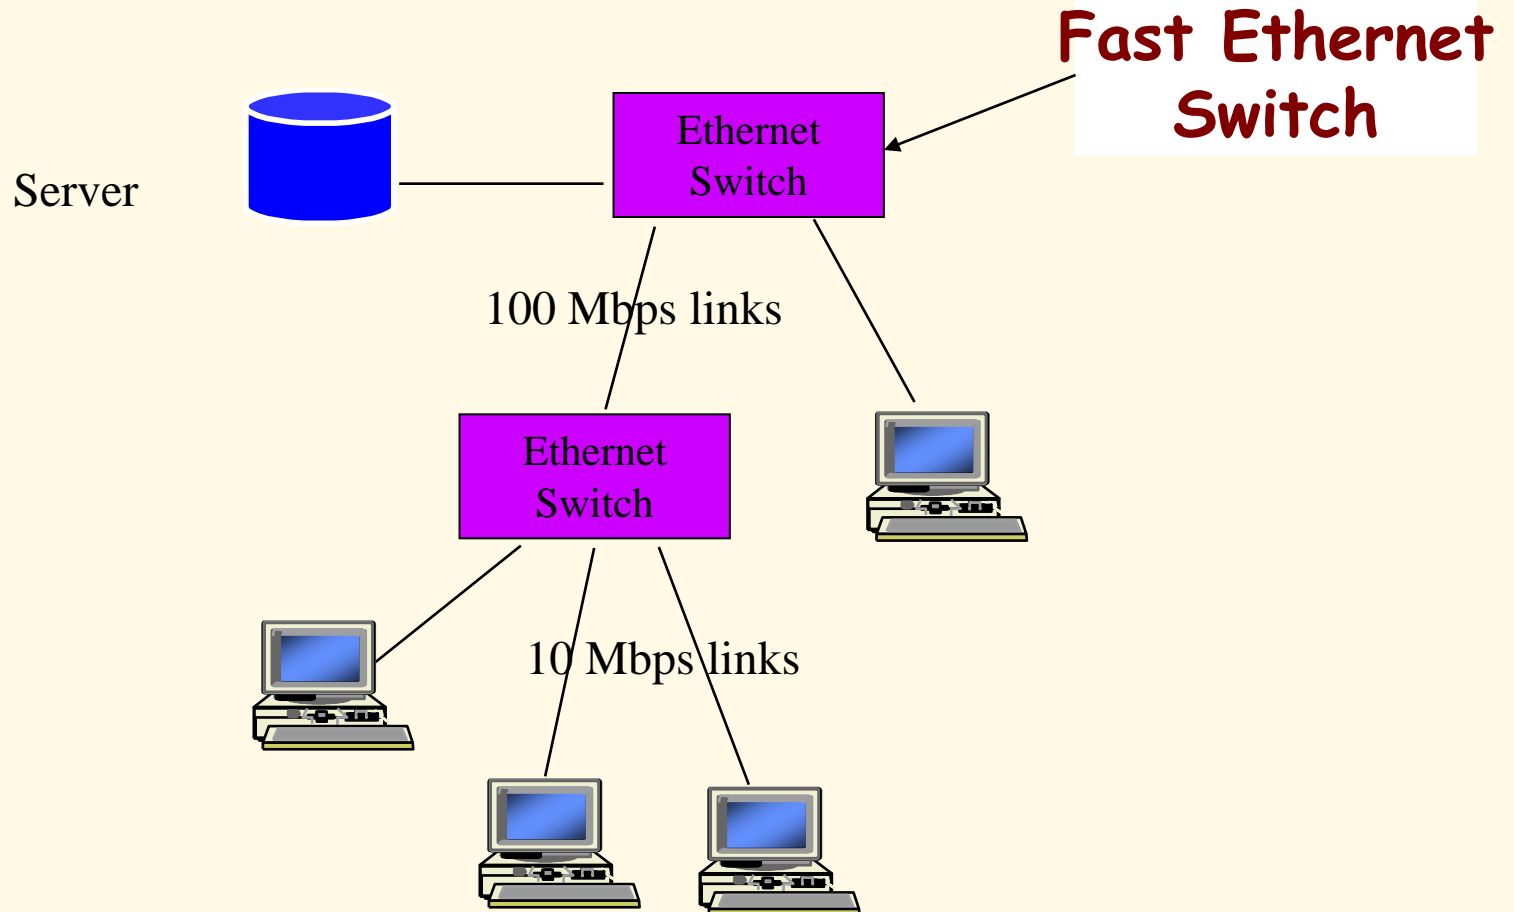

Figure 4-20. A simple example of switched Ethernet.

Tanenbaum

# Switched Ethernet Hub

- Since servers are often shared by multiple nodes, one can employ a **switching hub** with one port which operates at a higher rate than the other ports.
  - This requires extra buffering inside the hub to handle speed mismatches.
- Can be further **enhanced** by higher rated port full-duplex.

# Switching Hierarchy
